

# Opportunities for Exploiting Problem Structure in Unit Commitment MIP Models

Ed Rothberg

**GUROBI**  
OPTIMIZATION

# Gurobi Overview

- ▶ Founded in 2008 by Bob Bixby, Zonghao Gu, and Ed Rothberg
- ▶ Long history with the power industry
  - Bob Bixby often credited with sparking renewed interest in MIP models for unit commitment
    - September, 1999 Rutgers workshop
- ▶ Gurobi MIP solver widely used in the electrical power industry
  - At least 6 power industry software companies currently embed our solver

# MIP In Unit Commitment

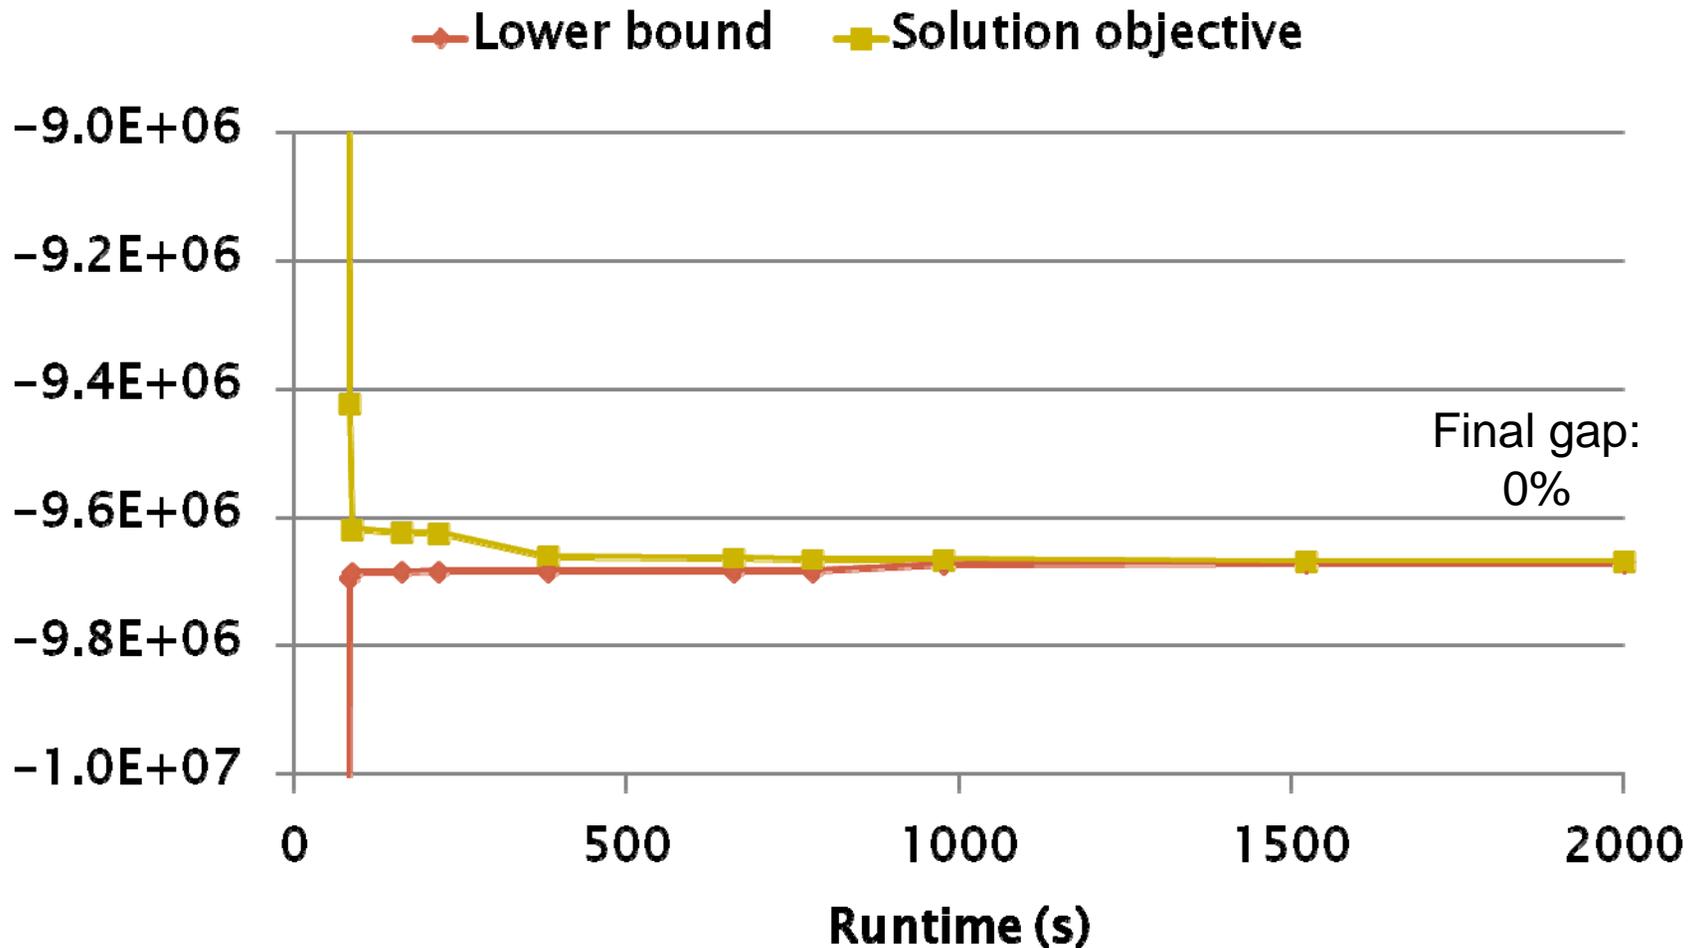

- ▶ MIP formulation and solution:

"The long solution times and slow convergence characteristics of earlier MIP solvers is why many experienced people question the ability of MIP algorithms to solve these NP-Hard problems"

"This effort has been so successful that virtually all of the current [MIP] problems solve to within reasonable convergence tolerances before entering the Branch and Bound phase"

– *A Mixed Integer Programming Solution for Market Clearing and Reliability Analysis*, Streiffert, Philbrick, and Ott, 2005

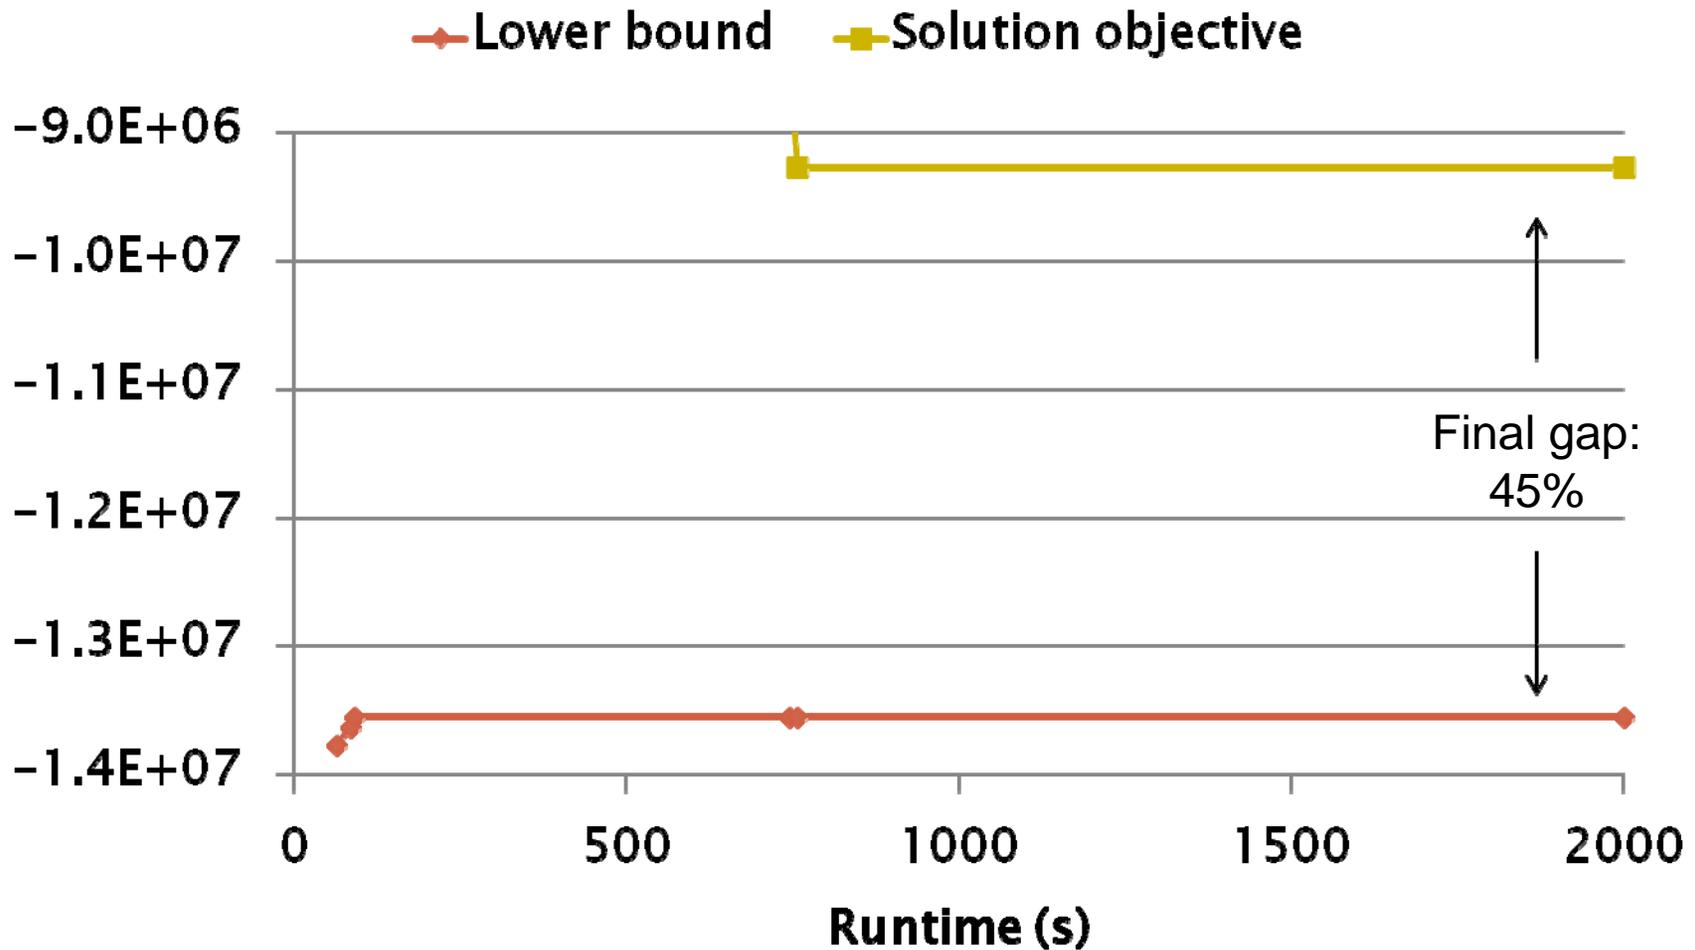

# MIP Optimality Gap - Commercial UC Model

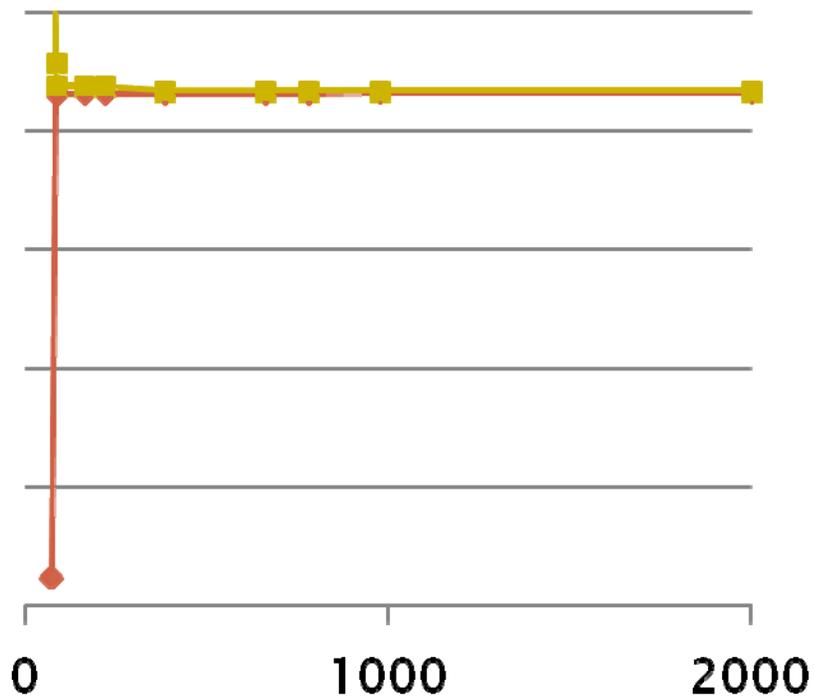

# Key MIP Solver Ingredients

- ▶ Key ingredients to this success...
  - Good model formulations
    - Tight linear relaxation
  - Cutting planes
    - Valid, redundant inequalities that tighten the linear relaxation
  - Heuristics
    - Inexpensive methods for converting a relaxation solution into an integer feasible solution

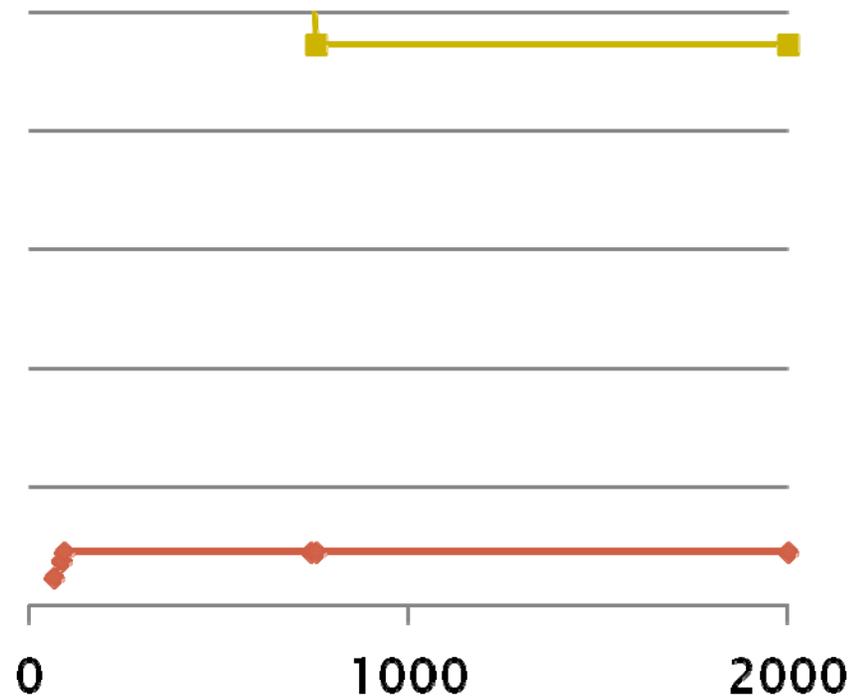

# MIP Optimality Gap- Cuts and Heuristics Disabled

# MIP Optimality Gap

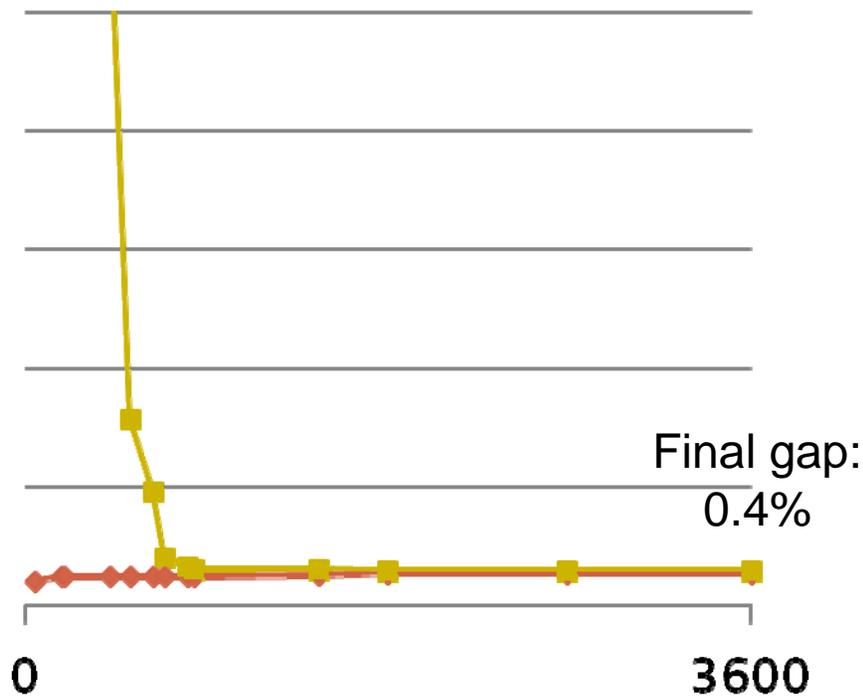

Default settings

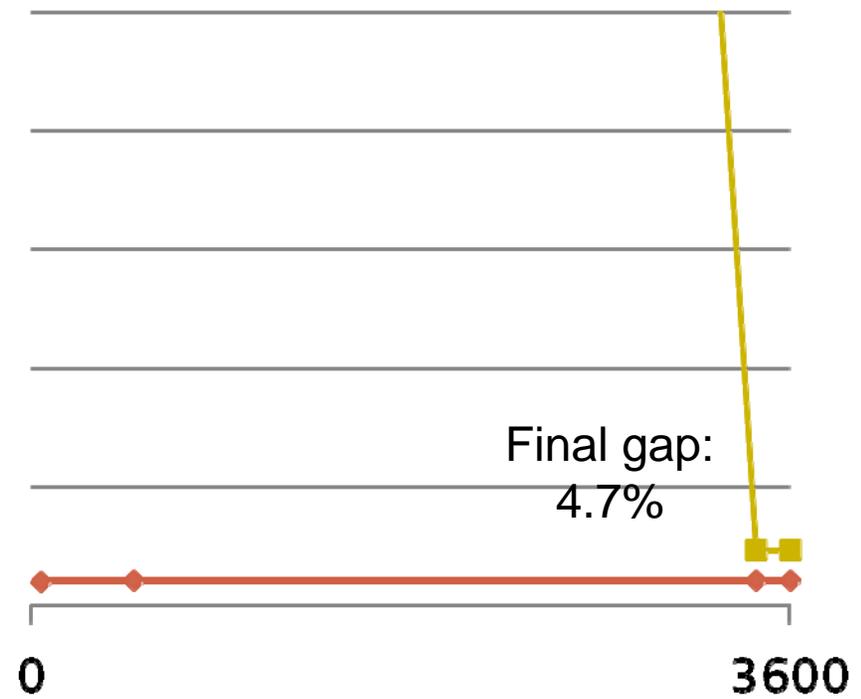

Cuts and Heuristics Disabled

# Larger Model – MIP Optimality Gap

Default settings

Cuts and Heuristics Disabled

# Can We Do Better?

- ▶ Is model structure being fully exploited?
- ▶ Would exploiting structure lead to...
  - ...better cutting planes?
  - ...better heuristics?

# Cutting Planes

**GUROBI**  
OPTIMIZATION

# Cutting Planes

- ▶ Long history of cutting plane development
  - Gomory cuts date back to the 1950s
- ▶ Gurobi 5.0 includes 13 different cut types
  - Gomory, clique, knapsack, flow cover, MIR, ...
  - Exploit different structure commonly found in MIP models

# Cutting Planes

- ▶ Exploiting unit–commitment structure
  - *Minimum Up/Down Polytopes of the Unit Commitment Problem With Start-Up Costs*, Rajan and Takriti, 2005
  - *Analyzing Valid Inequalities of the Generation Unit Commitment Problem*, Hedman, O'Neill, and Oren, 2008
  - *Tight Formulations for the Unit Commitment Problem*, Ostrowski, Anjos, and Vennelli, 2012
- ▶ Helpful in practice?
  - Tough to try on real data

# Cutting Planes

- ▶ Three main issues:
  - Complicated computational tradeoffs
  - Often redundant with existing cuts
  - Empirically: smaller scope for improvement than heuristics

# Heuristics

**GUROBI**  
OPTIMIZATION

# Heuristics

- ▶ Very successful paradigm for finding high quality MIP solutions
  - Solution Construction
    - Find any reasonable quality solution
      - Very poor quality solution often good enough
  - Solution Improvement
    - Use local improvement to successively improve the solution

# Solution Construction

- ▶ For UC models...
  - Trivial feasible solution
    - Turn every generator on
  - MIP solver doesn't find it
    - Set every binary variable to 1?
    - Some binary variables capture transitions (startup/shutdown)
- ▶ Clear indication that structure is being lost
  - Simple decisions often obscured in MIP model

# Solution Improvement

## ▶ Basic framework

- Solve a MIP model on a subset of the variables of the model
- Fix other variables to current solution values

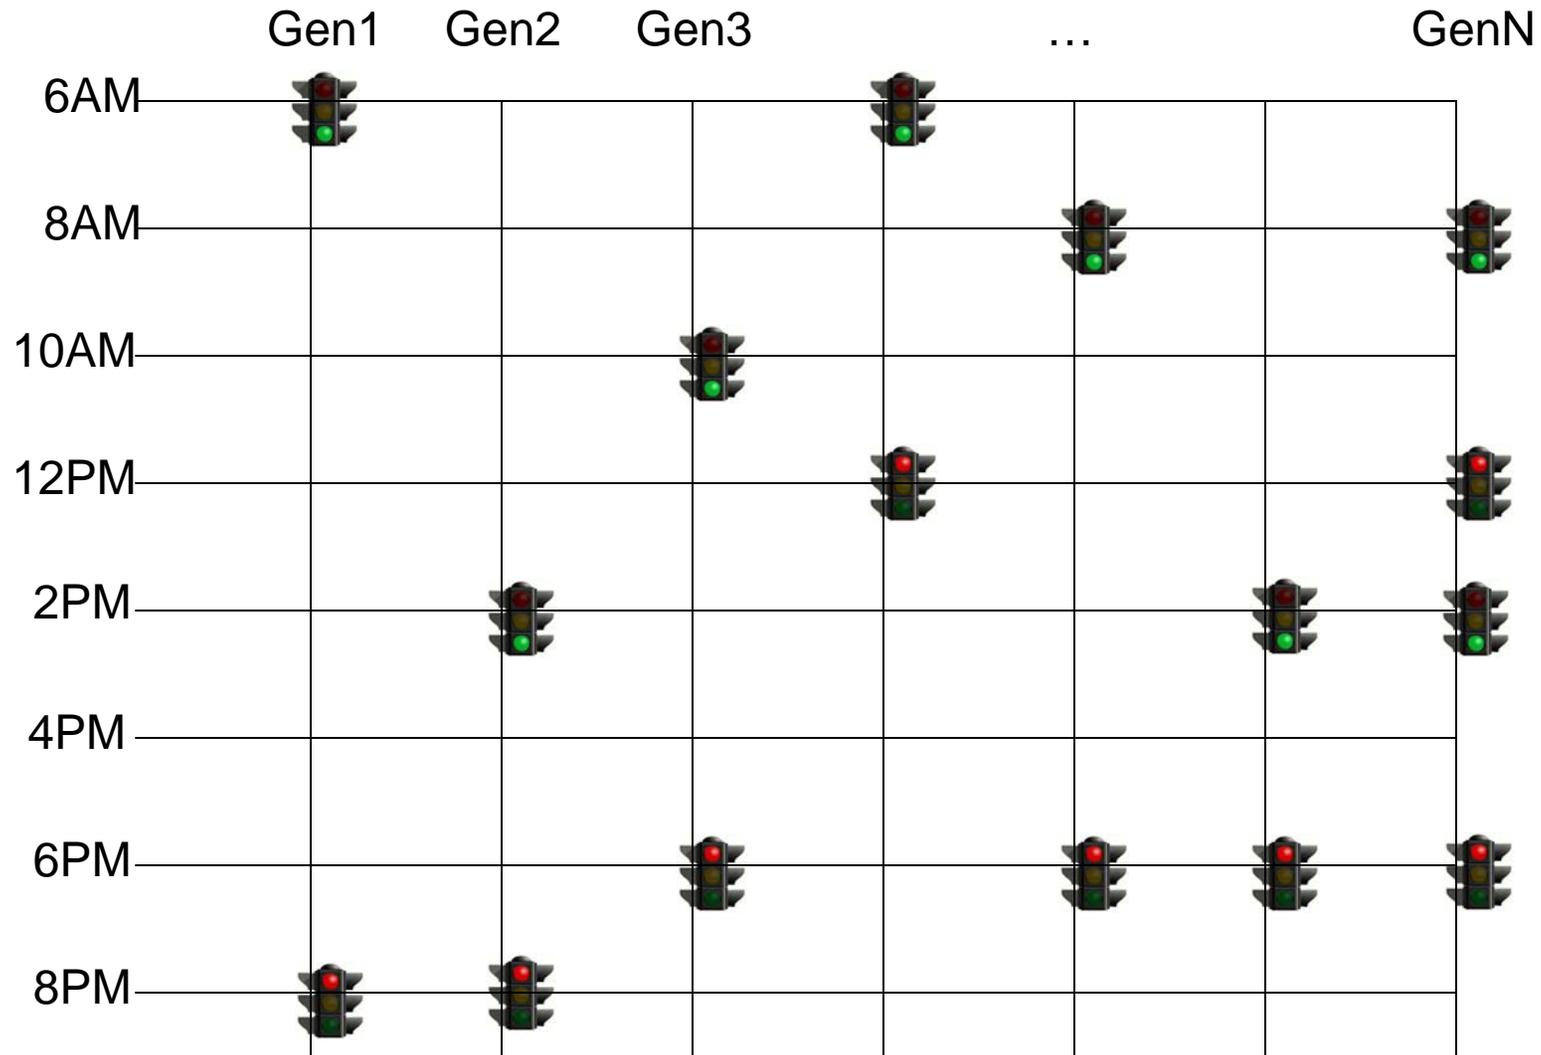

## ▶ Which subset?

- Use the LP relaxation to choose a neighborhood
  - *Relaxation Induced Neighborhood Search (RINS)* [Danna, Rothberg, Le Pape, 2003]
- Use meta-heuristics to choose neighborhoods
  - *Solution polishing* [Rothberg, 2007]

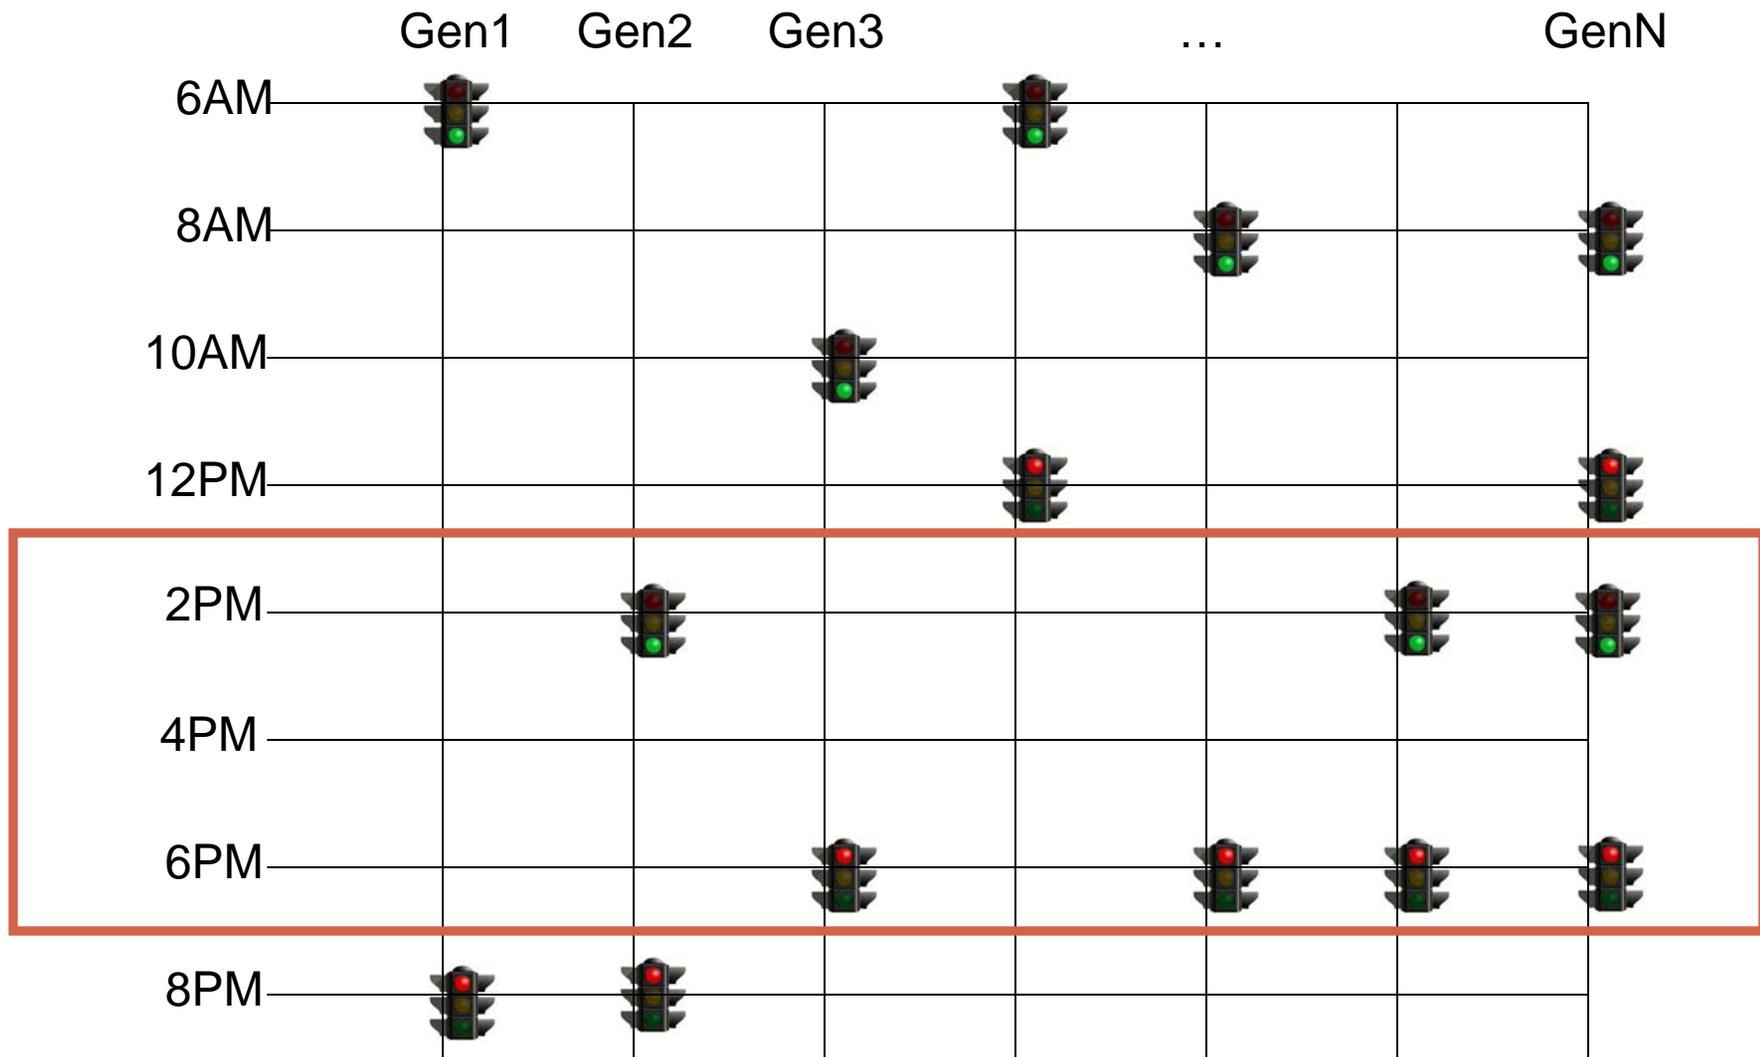

# Solution Improvement

- ▶ All rely on unstructured neighborhoods
  - No attempt to exploit problem structure
- ▶ Neighborhoods in unit commitment...

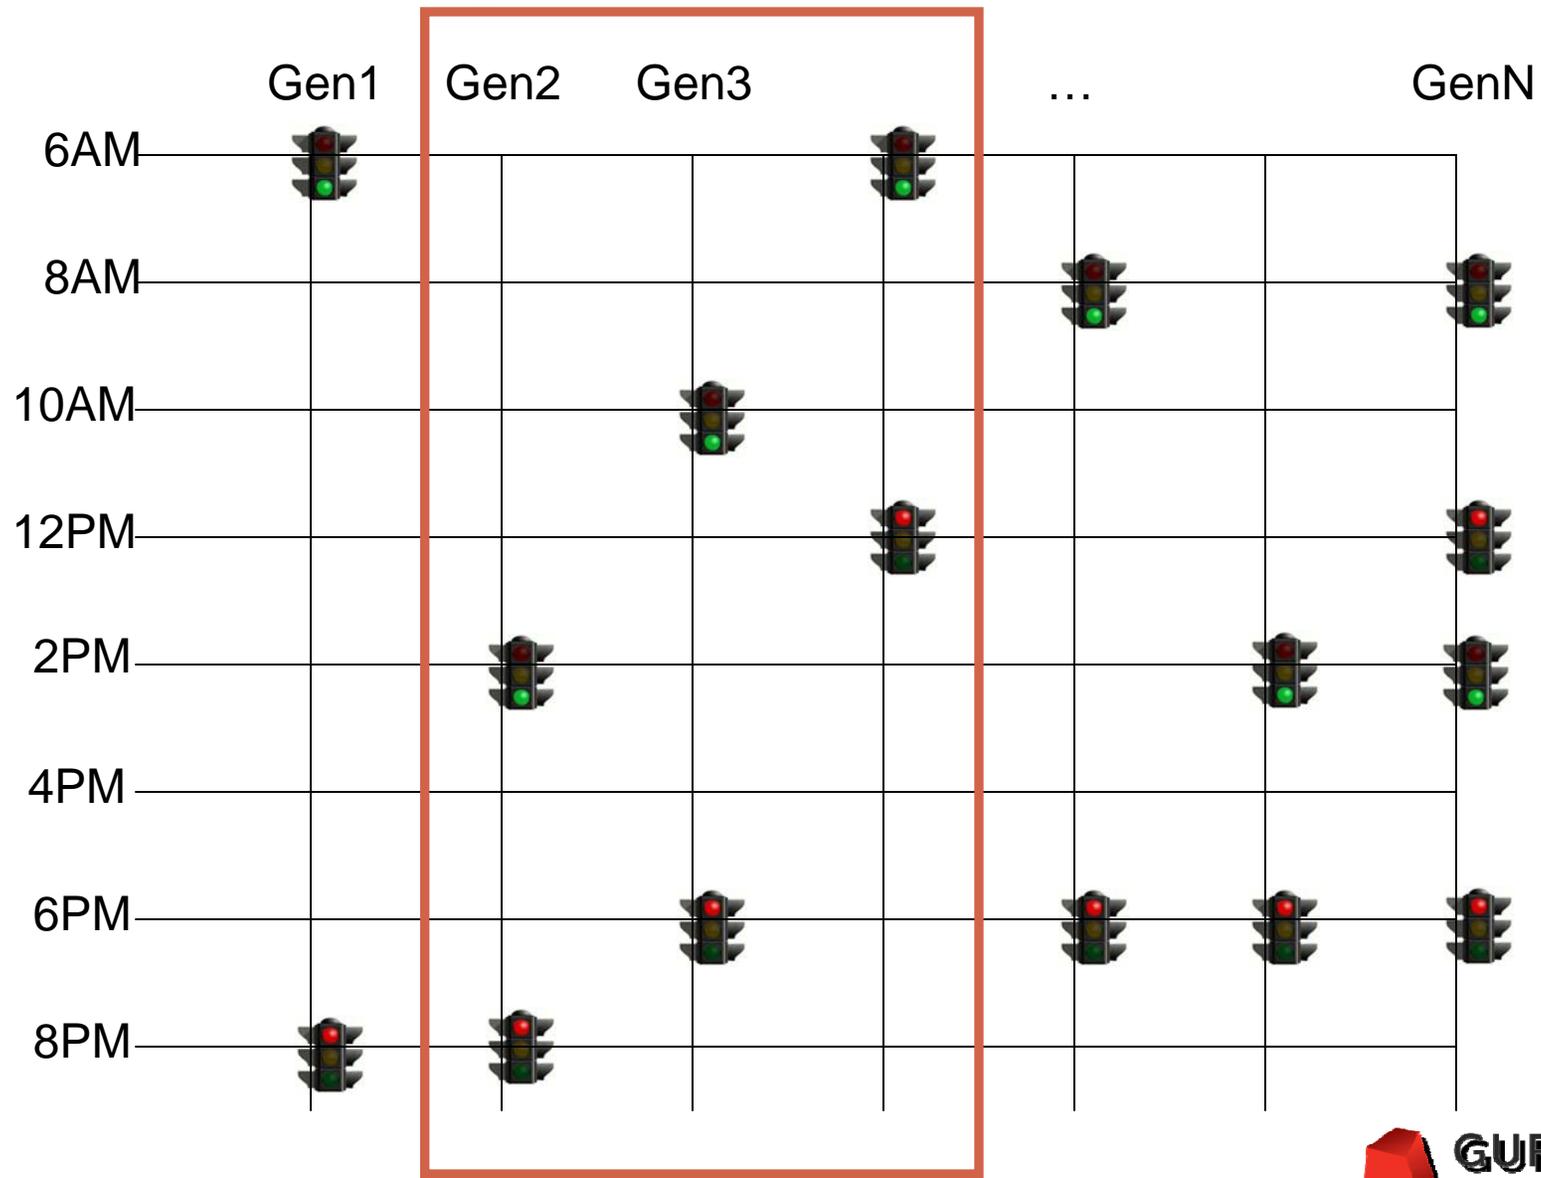

# Unit Commitment Model

# Structured Neighborhoods

# Structured Neighborhoods

# Conclusions

- ▶ MIP extremely effective for UC
- ▶ Model size and complexity has grown
  - Models don't solve at the root node any more
- ▶ Structure in UC models isn't being fully exploited
- ▶ Confident that results would significantly improve if we could understand/recognize model structure
