SMARTLINE TCF

Dynamic Line Rating
Transmission Capacity Forecasting

The logo for Lindsey, featuring the word "LINDSEY" in a bold, yellow, sans-serif font with a black outline and a slight shadow effect. The letters are slightly slanted to the right.

LINDSEY

Since 1947

SMARTLINE

TCF

LINDSEY

Feature Summary

- Provides real-time (instantaneous) DLR
- By direct measurement, methodology assures:
 - Clearance-to-ground limits are not violated
 - Thermal limits of the conductor are not violated
- Provides forecasts of line capacity capability
 - 1+ hours ahead
 - 1+ days ahead
 - Complex forecast “packages”
 - 98% confidence factor by default
- Line sensors directly measure critical parameters
- Cloud-based software provides direct EMS input
- Cyber-secure
- SOON: Transmission Line Asset Management

Overview of SMARTLINE-TCF

Live weather data

Develop Learned Conductor Behavior Model

Weather forecast data

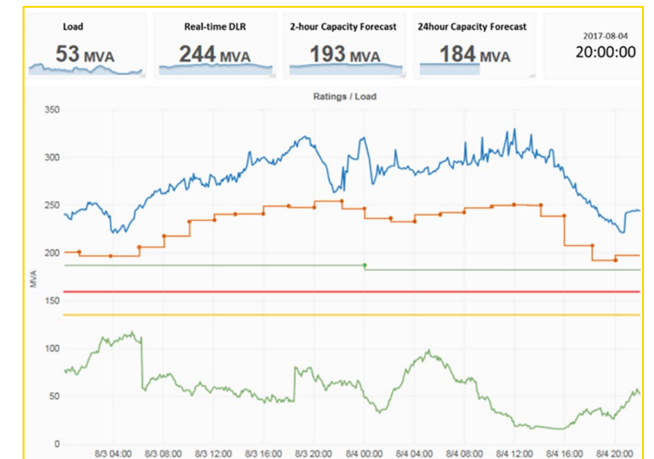

Line Power Capacity Forecast

Compute Instantaneous DLR

Based on:

- Clearance
- Conductor temperature

What limits line rating?

Clearance to Ground

- A line is not safe unless clearance is maintained
- Compliance requirements

Conductor Temperature

- Overheating leads to weakening and loss of life
- Premature replacement

What effects these parameters? Weather.

Optimizing line capacity based on weather

- Line ratings (static) are traditionally based on conservative weather conditions
- **Seasonal Adjusted Ratings** and **Ambient Adjusted Ratings** recognize weather related effects on line capacity
 - Both adjust only on ambient temperature

Optimizing line capacity based on weather

- Line ratings (static) are traditionally based on conservative weather conditions
- **Seasonal Adjusted Ratings** and **Ambient Adjusted Ratings** recognize weather related effects on line capacity
 - Both adjust only on ambient temperature
- Wind has MUCH more impact than ambient
 - +2 mph wind \cong 15°F change

LiDAR unit provides **CONTINUOUS
CONDUCTOR TO GROUND MEASUREMENTS**

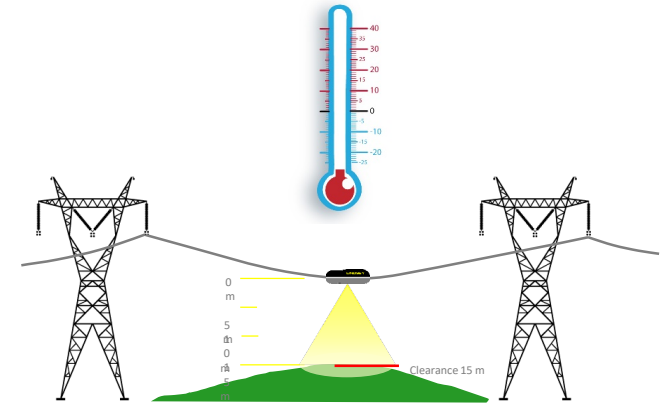

OVERVIEW

SMARTLINE TCF

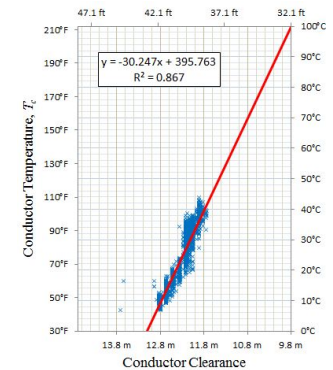

Combines:

- Real-time weather
- Corresponding **direct measurements:**
 - Conductor temperature
 - Clearance-to-ground
 - Recall these are the critical line parameters

To Produce:

- Continuously learned line behavior model

Dynamic Line Rating

Decades of studies show +10-25% capacity availability 95% of the time

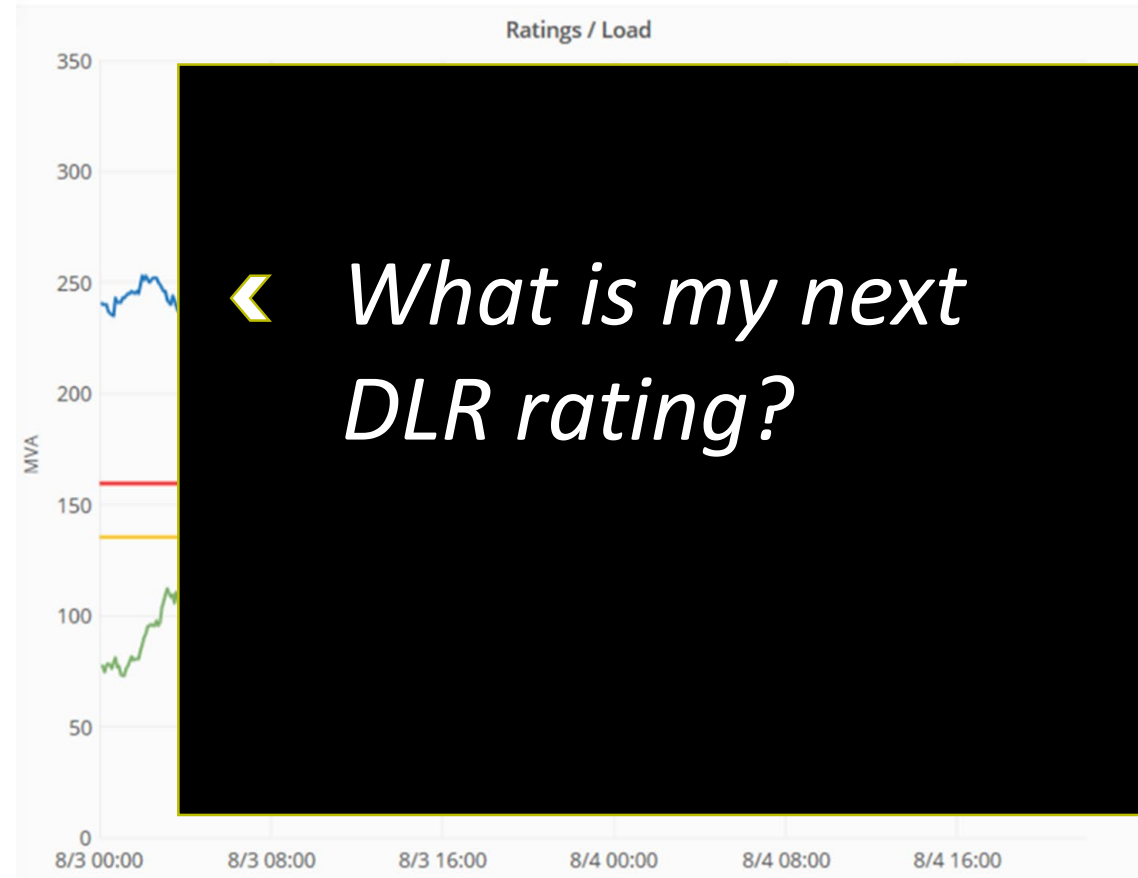

BUT

- Changes rapidly
- Changes erratically
- Real-time

Dynamic Line Rating

The Historical Dilemma

Dynamic Line Rating

*RAPID
ERRATIC
REAL-TIME*

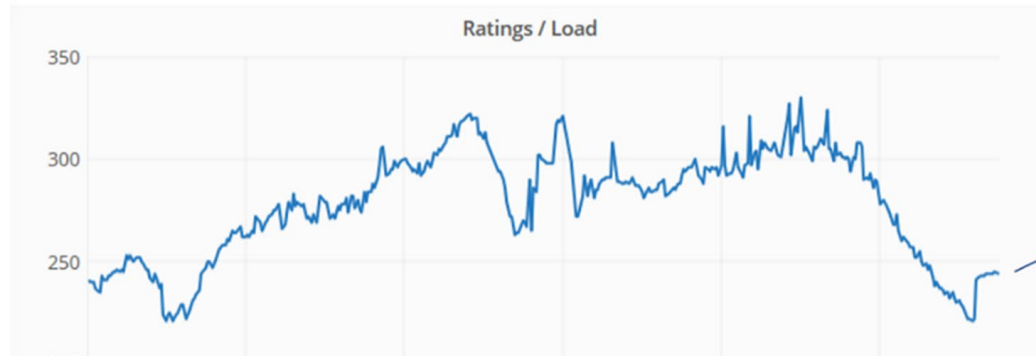

Using Real-time DLR is operationally difficult

Dynamic Line Rating

Like a map app in a traffic jam...

LINDSEY

...Real-time is too slow

Generation is FORECAST
because it varies

Load is FORECAST
because it varies

Yet transmission capacity is
generally assumed as fixed

Transmission Capacity Forecasting

What is it?

- **An advanced statistical process that provides:**
 - Forecasts of transmission line capacity from 1-hour to 1-week ahead
 - Very high (98% or greater) confidence factors
 - Local line measurements avoids weather-only errors
- **Can provide direct EMS input**
- **Combines:**
 - Learning-based conductor behavior models
 - Continuous Forecasting

Transmission Capacity Forecasting

Transmission Capacity Forecasting

Per DOE Report, DLR and TCF Provide:

- Congestion Relief
- Increased Resilience
- Increased Reliability
- Enhanced Market Operations
- Situational Awareness
- Curtailment Reduction
