## 1 PROCEEDINGS

- 2 (9:00 a.m.)
- 3 MR. QUINN: I would like to welcome everyone to
- 4 this two day technical conference. We are gratified by the
- 5 interest -- the level of interest that all of you have
- 6 shown. Today is an opportunity for us to hear from
- 7 panelists that have been pre-selected.
- 8 Actions that purposely interfere or attempt to
- 9 interfere with the commencement or conducting of the
- 10 Conference or inhibit the audience's ability to observe or
- 11 listen to the Conference, including attempts by audience
- 12 members to address the Commission while the Conference is in
- 13 progress are not permitted.
- 14 Any person engaging in such behavior will be
- 15 asked to leave the building. Anyone who refuses to leave
- 16 voluntarily will be escorted from the building. Alright so
- 17 to start off I'll go through a couple logistical
- 18 housekeeping items.
- 19 Please no food or drinks other than bottled water
- 20 in the Commission meeting room. There are bathrooms and
- 21 water fountains behind the elevator banks on each end of the
- 22 building. Please turn off your mobile devices or put them
- 23 in the airplane mode while in the Commission meeting room to
- 24 avoid interference with the audio visual and the sound
- 25 equipment.

- 1 If needed we have arranged for spillover space in
- 2 Hearing Rooms 1, 2 and 4 as well as Room 3M2AB on the third
- 3 floor. The Hearing Rooms are past the elevators to the
- 4 right as you exit this room. I imagine you all don't need
- 5 to hear that but bags are to be put in Hearing Rooms 1 and
- 6 2.
- 7 We will break for lunch on the first day today at
- 8 approximately 12:20 until 1:30, on the second day from
- 9 approximately 12 P.M. until 1 P.M.
- 10 For panelists -- if you would like to be
- 11 recognized to speak please put up your name card. Be sure
- 12 to turn on your microphone and speak directly into it so
- 13 that the audience and those listening to the webcast can
- 14 hear you.
- 15 This Technical Conference is being transcribed so
- 16 please say your name when you start to speak. When you are
- 17 not speaking please turn your microphone off to minimize
- 18 background noise. Panel discussions will not include
- 19 opening remarks, but will consist of a discussion based on
- 20 the questions posed by Commission staff in the Notice.
- 21 And finally depending on which direction the
- 22 conversation progresses, we will not necessarily cover every
- 23 single question in the Notice however we have members of
- 24 staff who will help us monitor the time so we make sure that
- 25 we can cover as much as possible in each one of the panel

- 1 sessions.
- With that out of the way I'll turn over to acting
- 3 Chairman LaFleur.
- 4 CHAIRMAN LA FLEUR: Good morning everyone and
- 5 welcome. I very much appreciate folks traveling here early
- 6 on a Monday morning to be part of this Conference. As Arnie
- 7 said we appreciate the vast interest in the Conference. I
- 8 hope it is not just because the movie theatre has been dark
- 9 for a while but you actually want to see the movie that you
- 10 came to see. Thank you for bearing with us as we attempt to
- 11 make our facilities accommodate all of you.
- 12 And I want to thank staff for the tremendous
- 13 amount of work, both substantive and logistical they have
- 14 done just to get us to 9 A.M. May 1 so thank you.
- 15 I believe the issue that we are going to be
- 16 discussing today and tomorrow, the interplay between our
- 17 competitive wholesale markets and state policy choices on
- 18 the selection of resources is the most critical issue we are
- 19 confronting right now.
- 20 And the interest in this Conference suggests many
- 21 people agree. It is no secret that I am a strong supporter
- 22 of the wholesale competitive markets which I believe have
- 23 done an excellent job of meeting the objectives for which
- 24 they were designed.
- 25 Procuring and dispatching resources to keep the

- 1 lights on at least cost to customers. The markets,
- 2 particularly the centralized capacity markets in the three
- 3 regions we are talking about today and tomorrow are designed
- 4 to signal new entry and exit through a transparent price
- 5 signal rather than through integrated resource planning used
- 6 in the vertically integrated model.
- 7 As we all know in recent years, recent months and
- 8 recent week's states that restructured their retail
- 9 electricity service have taken steps to attract and retain
- 10 resources outside the construct of the competitive markets.
- 11 These actions are driven by various state policies and seem
- 12 to indicate dissatisfaction with the resource choices that
- 13 the competitive markets are making for the region.
- 14 On the one hand I am concerned that out of market
- 15 actions can undercut the operation of the market for
- 16 non-subsidized resources and the price signals that are
- 17 needed for entry and exit when needed.
- 18 On the other hand having been a veteran of the
- 19 prophecies that led to these markets, I am very well aware
- 20 that the wholesale markets in the eastern states are the
- 21 product of state restructuring and state's choices and they
- 22 only can exist and continue through the buying of the
- 23 states, therefore there's a real task.
- I have said very many times there are three basic
- 25 ways this could go -- a design market solution, a litigated

- 1 outcome or a planned change in the regulatory construct of
- 2 how we handle resource advocacy.
- 3 The fourth outcome, an unplanned change in the
- 4 regulatory construct, or unfounded piece meal regulation is
- 5 one that I think we should avoid because I think it would be
- 6 a bad outcome for customers and market participants in terms
- 7 of cost, reliability and regulatory certainty.
- 8 By the way I read all of the testimony and
- 9 several people made the point which is correct that these
- 10 three doors are not mutually exclusive. Once we restore our
- 11 quorum this Commission will almost certainly have to decide
- 12 litigated complaints that are already pending before us,
- 13 even a grievance may be working on market solutions to file
- 14 with us.
- 15 Design solutions may themselves suggest changes
- 16 in the regulatory compact and different regions almost
- 17 surely will take different paths and different timing. But
- 18 I do think the three different paths, re-design of the
- 19 market, litigation or a change in how we do resource
- 20 advocacy lead to very different places and present different
- 21 trade-offs and issues that we have to confront.
- 22 My goal for the next two days is to really
- 23 explore where the different outcomes lead so that we can all
- 24 make an informed and deliberate decision about what's next.
- 25 While we can't decide anything immediately because we lack a

- 1 quorum, we must shape options and recommendations for FERC
- 2 2.0 based on the record we develop today and tomorrow.
- 3 As I said I read all the pre-filed testimony and
- 4 took notes, including from the panelists who were speaking
- 5 and I know that Colette and the team and the senior staff
- 6 did as well so there is no need for anyone to repeat their
- 7 testimony or recite the positions that you have taken for
- 8 some time.
- 9 Our goal is to have a facilitated dialogue that
- 10 pushes more deeply on the issues. A few of the questions
- 11 that I would like answered -- for those of you who said, and
- 12 there were many, that state decisions to procure new
- 13 resources out of the markets, substantial new resources are
- 14 not a problem and the markets should just step aside and let
- 15 the chips fall.
- 16 My question is do you expect the markets will
- 17 have to attract new unsubsidized resources in the future
- 18 based on market price signals or do you see all resources
- 19 from now on being chosen out of the markets by the states
- 20 beyond the resource we already have in the markets?
- 21 And does that include resources to replace
- 22 resources that are in the markets now that might now be able
- 23 to survive a hybrid structure? For those of you -- and
- there were also many who urged FERC to man up, step in,
- 25 assert our jurisdiction, tighten the minimum offer pricing

- 1 rules to correct the state's subsidies -- do you have a plan
- 2 for what happens after that?
- 3 Are you ready to negotiate a new market solution
- 4 or do you expect the states to not procure resources or pay
- 5 subsidies required by legislation? And for the State
- 6 Representatives beginning with my homies here -- I know you
- 7 have the most difficult job of all because it is hard for
- 8 you to state your positions because of your positions but
- 9 your views are actually the most important we are going to
- 10 hear which is why you have the floor to yourself in each of
- 11 today's panels.
- 12 Do you anticipate relying on the capacity markets
- 13 to attract investment in the future or do you see all future
- 14 resources being chosen by the states to meet state goals?
- 15 We can best design a solution and modify the existing
- 16 resource adequacy construct if we have some sense of where
- 17 you think you are headed, not just in the short run but
- 18 going forward.
- 19 As I was reading all the testimony over the
- 20 weekend, one piece of testimony really hit me in my gut and
- 21 that was a long quote by Sue Tierney from testimony that she
- 22 submitted in our September, 2013 Capacity Market Technical
- 23 Conference that could just have well been written last week.
- 24 And it has been almost four years since that
- 25 Conference. That really made me realize that we have not to

- 1 be dramatic, I think we have a moment in time here and now
- 2 to confront this issue and try to put ourselves on a path to
- 3 resolution.
- 4 I don't want our successors to be sitting in this
- 5 room in 2021 having the exact same conversation or picking
- 6 up the pieces of a mess that we failed to avert. And
- 7 speaking of things that hit me in my gut I am very happy to
- 8 have my wonderful colleague sitting beside me and very sad
- 9 we won't have as many future opportunities together as I had
- 10 wished, Collette.
- 11 COMMISSIONER HONORABLE: Thank you Cheryl. Good
- 12 morning everyone. Cheryl and I held hands and said we would
- 13 not have any sappy moments this morning and let me just
- 14 address the elephant in the room. The surest thing about
- 15 coming to this wonderful work is that one day you must leave
- 16 it and it has been short in many ways but in some ways I
- 17 feel like we have done so much together.
- 18 And don't worry it isn't goodbye. While alas,
- 19 parting is such sweet sorrow this isn't goodbye. It's just
- 20 I'll see you around. My daughter loves this area so I am
- 21 not going anywhere anytime soon. Where I am going and when
- 22 I am going remains to be seen so I won't be taking any
- 23 questions about that today.
- In fact, I hope all of the questions and
- 25 attention today will be focused on the reason why we have so

- 1 many of you in this room and so many others -- maybe it is a
- 2 record, at least during my tenure here in what, four
- 3 overflow rooms. It's phenomenal this is the best party that
- 4 we could have today.
- 5 Focus on this intersection of the operation of
- 6 wholesale markets and the development of state policy --
- 7 this is important work that we really must be focused on
- 8 today. But know that I loved this work and I still do each
- 9 and every day and I hope that you have seen that through our
- 10 meetings and engagement and I look forward to our continued
- 11 work together. So let's get to work.
- I want to thank all of you for being here.
- 13 Clearly there is tremendous interest in this topic and I too
- 14 want to begin by thanking our staff. FERC senior staff you
- 15 see leading the way and Arnie who ably commanded the
- 16 presence in this room maybe better than we have and also to
- 17 Jamie and David and so many others, I want to especially
- 18 thank the FERC staff.
- 19 Some of them you see sitting here. Dozens of
- 20 others with whom I have met with my team over the last
- 21 couple of months as we have discussed these issues -- I want
- 22 to thank them for all of their work, especially in this
- 23 unprecedented time without a quorum.
- 24 And Cheryl mentioned that maybe some are
- 25 suggesting that we man up and maybe we are "womaning" up in

- 1 this moment. I hope that what you see is that we are
- 2 working hard here and we have heard you. Some of you are
- 3 wondering, in fact I received a question internally this
- 4 morning -- why now? Why are we having a Tech Conference now
- 5 without a quorum?
- 6 We have met with a number of you over the course
- 7 I would say years about the challenges as they are
- 8 developing and tensions as they are growing, particularly
- 9 after the issuance of the now three, the trilogy of the U.S.
- 10 Supreme Court cases and a number of our decisions here at
- 11 FERC, a number of actions taking place in regions.
- 12 I really don't think we could have a better time
- 13 to tee up this discussion and I want to thank all of the
- 14 stakeholders who have invested time and effort away from the
- 15 Commission but also those of you who have for time and time
- 16 again come into apprise us of not only your progress but of
- 17 your concerns as well.
- 18 I believe that the conversations taking place at
- 19 the regional level are really vital idea incubators and the
- 20 beautiful thing about the ways in which we work regionally
- 21 is that we truly appreciate the diversity of experience, of
- 22 expertise of thought and about your creativity and
- 23 innovation in helping us find the best pathway forward.
- 24 So today's Conference in my mind is not meant to
- 25 supplant or replace those regional conversations but rather

- 1 designed to support them by bringing the Commission's
- 2 presence into a broader discussion.
- 3 Pardon my comments a little longer than I would
- 4 ordinarily give -- Cheryl and I haven't had time to do this
- 5 in a few months now so we have a little pent up -- a few
- 6 thoughts we would like to share.
- 7 So while today my role is one to enjoy really the
- 8 luxury of sitting at what we call the kitty table to take in
- 9 what we are hearing today. I am excited to be able to do
- 10 that and not worry about the clock and who is moving around
- 11 but to really listen to each of you.
- 12 Thank you for saying yes and being willing to
- 13 come and share your expertise with us as we take on these
- 14 challenging issues. I want to touch on what I'm looking to
- 15 get out of this Conference. I am hoping that over the
- 16 course of the next two days we will hear from you, not the
- 17 other way around -- you have done that enough by now.
- 18 I am looking forward to hearing about in great
- 19 detail your stakeholder discussions, what you perceive the
- 20 challenges to be as well as any thoughts about potential
- 21 solutions -- even if untested, even in their infancy. At
- 22 the conclusion of this effort I am hopeful that we will be
- 23 able to see at least a glimmer of light at the end of the
- 24 table.
- 25 I have heard Cheryl say we won't have smoke

- 1 coming from the room we can dust off our hands and say we
- 2 are done. Let's be realistic. But what I am hopeful about
- 3 is that we will hear ideas from you about potential pathways
- 4 going forward or at least identify the foundations upon
- 5 which we can build upon collaboratively.
- I too, am not expecting to have fully vetted
- 7 solutions but rather I believe our collective purpose here
- 8 over the next couple of days should be to develop a sound
- 9 record upon which the Commission can act at some future date
- 10 when we get our new colleagues here to provide better
- 11 guidance to stakeholders not only in the three regions, but
- 12 more broadly across our national footprint.
- 13 So this Conference and subsequent comments will
- 14 help build the record that we can consider when we develop,
- 15 when we attain a quorum and as these issues develop before
- 16 us properly here at the Commission.
- 17 Importantly and I must say this in deference to
- 18 my state colleagues, as a former state regulator I certainly
- 19 and especially want to hear how we can better cooperate and
- 20 collaborate with our state colleagues.
- 21 And there can be a tension that arises amongst
- 22 our federal and state roles but I believe if we are
- 23 disciplined and we have the ability to harness this
- 24 opportunity we can use that tension to work through and
- 25 arrive at solutions that work well for all of us. And my

- 1 hope is that we can collaboratively work through these
- 2 challenging times and provide opportunities that ensure that
- 3 markets operate as intended, support state policy objectives
- 4 and best serve consumers.
- I too, recognize that there may not be a one size
- 6 fits all approach and I particularly appreciate -- yes I too
- 7 have read the pre-filed comments. Thank you for doing that
- 8 in advance and thank you for sharing, even if you are
- 9 testing the waters, some of the ways in which you are
- 10 working to accommodate state actions and particularly I am
- 11 interested in what's happening with ISO New England.
- 12 I want to hear about how you have walked this
- 13 path over quite a bit of time to arrive at where you are and
- 14 also from the New York ISO and maybe some of the things that
- 15 you are working on in creative ways to find solutions going
- 16 forward.
- 17 FERC has also consistently embraced solutions
- 18 that embrace the uniqueness of each market and so although
- 19 we are bringing three regions together today my expectation
- 20 is that a solution for ISO New England may in fact differ
- 21 for one for New York ISO or PJM.
- 22 And I believe again that the pre-filed comments
- 23 beautifully bear out your courageousness and innovation
- 24 going forward. I am also looking for ideas that can support
- 25 markets comprehensively over a broader time horizon and that

- 1 are not just stop gaps or efforts to plus holes. Market
- 2 participants indeed depend upon stable market rules when
- 3 making investment decisions and I worry that any solution
- 4 that is short lived will only serve to introduce more
- 5 uncertainty that will unnecessarily and inevitably dampen
- 6 participation.
- 7 And I believe we all by virtue of our mere
- 8 presence today truly do embrace robust markets and I am
- 9 hopeful that we can really rally around that concept at its
- 10 core.
- 11 As I mentioned in the statement I released
- 12 contemporaneously with the issuance of the Notice announcing
- 13 this Tech Conference, all options in my mind are on the
- 14 table. This is in fact a new day. We aren't going back to
- 15 a time when states weren't so active, particularly in the
- 16 region we are here today to focus upon.
- 17 And I think that we can learn from these
- 18 challenges and these times going forward in a way that works
- 19 best for all market participants. So in closing I have a
- 20 page left. What are some of the issues on my mind?
- 21 First, states have a responsibility to enact
- 22 policies that are in their citizen's interest. Let's be
- 23 real about that and that's what we expect the states to do.
- 24 I believe that the Commission should take a cooperative
- 25 approach and only take action when necessary to ensure just

- 1 and reasonable rates.
- 2 Many of the comments focus on how far wholesale
- 3 markets can bend without breaking to incorporate state
- 4 policy goals. And I think that this notion is captured in
- 5 the achieved versus accommodate on that process. Again I
- 6 want to hear more about that.
- 7 I recognize that finding the right balance is
- 8 difficult and one that must include investment, policy and
- 9 consumer perspectives. And I want to briefly touch on
- 10 several issues that cross the three regions.
- 11 First, MOPR -- we know it has certainly been a
- 12 challenge and I appreciate the perspectives that were shared
- 13 in the Pre-Tech Conference comments about the pathway that
- 14 you see going forward. I took to heart certainly those
- 15 comments from Dr. Patton and others that speak to your
- 16 thoughts about how MOPR should be employed by the Commission
- 17 going forward.
- 18 It is certainly a blunt tool and its application
- 19 varies considerably across the three markets being discussed
- 20 at this Conference. And I know over the course of my tenure
- 21 a number of you have come in either supporting the ways in
- 22 which we have used it and employed it and others of you that
- 23 have said it absolutely has to change. So I hope to hear
- 24 more of that discussion today.
- 25 And in my opinion it is often the point of

- 1 friction between state policies and wholesale markets that
- 2 we regulate but I also believe MOPR is naturally a part of
- 3 this conversation and I hope that we can talk more about how
- 4 this tool and other mitigation tools may be employed going
- 5 forward.
- 6 Another cross cutting issue in my mind is the
- 7 future of wholesale energy and capacity markets. As several
- 8 of you have commented we are quickly advancing to a reality
- 9 where marginal costs for many resources in the energy market
- 10 are negligible and this can have profound impacts on
- 11 revenues collected from energy markets and place additional
- 12 pressure on capacity and ancillary services.
- 13 I believe we are already seeing this play out in
- 14 California and I would like to better appreciate how the
- 15 ideas discussed at this Conference work in connection with
- 16 this broader trend.
- 17 Similarly, wholesale markets identify cost
- 18 efficient resources without attributing resource attributes,
- 19 whether it is to integrate renewables to foreign
- 20 environmental considerations that are indeed the focus of
- 21 various policies. And I too have a few questions.
- 22 Should wholesale markets approach cost efficiency
- 23 differently in order to best serve consumers? Another
- 24 question that I have -- should state policies be reflected
- 25 in efficiency decisions -- some of your comments have

- 1 touched upon that.
- 2 Some of you believe that there may be a middle
- 3 approach to addressing that and so I would like to hear from
- 4 you. And if so, what broader reform should we consider to
- 5 reflect or potentially price these resource attributes?
- 6 These are tough questions I acknowledge.
- 7 I want to close by thanking my personal staff in
- 8 particularly Will Sauer who has been my point person for
- 9 helping me with this Tech Conference but my entire team. I
- 10 often say and Cheryl has heard me say I have the very best
- 11 team. She'll say something different I will imagine.
- 12 But I really feel well supported by them and I
- 13 wanted to take this opportunity to close in thanking them
- 14 and thanking all of you. I look forward to the discussion.
- 15 MR. QUINN: Alright thank you Commissioners. You
- 16 have done a nice job of setting us up for the day and for
- 17 the next two days. So today's discussions will involve
- 18 three sessions one for each one of the eastern RTO's or
- 19 ISO's.
- There will be two panels for each session. The
- 21 first panel will be a panel of State Representatives and the
- 22 focus will be on getting the state's perspective. The
- 23 second panel will be of industry stakeholders and the focus
- 24 there will be yet the stakeholder perspective on the broad
- 25 side of discussions that we are having.

- 1 At the very highest level Day 1 will be about
- 2 framing, identifying issues. Day 2 will be about completing
- 3 the picture, rounding out the sense of what our possible
- 4 alternatives are and the implications of those alternatives.

- 6 There is clearly some potential for overlap
- 7 between the discussions we will have today and the
- 8 conversations that we will have tomorrow. Staff is going to
- 9 try to keep the conversations moving to avoid that overlap
- 10 but it is probably inevitable to some degree.
- 11 So to start our first panel I would like to start
- 12 by welcoming our panelists, thanking you for your time and
- 13 the pre-Conference statements. We have Jeffrey Bentz, the
- 14 Director of Analysis for the New England States Committee on
- 15 Electricity.
- We have Sarah Hofmann, Board Member for the
- 17 Vermont Public Service Board and speaking on behalf of the
- 18 National Council on Electric Policy.
- 19 We have Commissioner Robert Klee, a Commissioner
- 20 for the Department of Energy and Environmental Protection in
- 21 Connecticut.
- We have Chairman Angela O'Connor from the
- 23 Massachusetts Department of Public Utilities and we have
- 24 Robert Scott, a Commissioner at the New Hampshire Public
- 25 Utilities Commission.

- 1 So on this first panel we would again like to get
- 2 your perspective on the policies that you are pursuing, the
- 3 kind of goals that you have and we would also like to better
- 4 understand what role you think the wholesale markets are
- 5 playing broadly but also in pursuit of the goals and
- 6 objectives that you have identified for the policies that
- 7 your state has decided to use to support and encourage
- 8 either specific resources, particular resource types, or
- 9 particular resource attributes.
- 10 So I think we will start with I think a question
- 11 that both the acting Chairman and Commissioner Honorable
- 12 identified. A number of the pre-Conference statements
- 13 suggested that new resources -- all new resources could
- 14 potentially come into the market as a result of state
- 15 programs to encourage or support specific resource types or
- 16 specific resources.
- 17 And that maybe the only role for the capacity
- 18 markets at least is to organize exit of the resources that
- 19 are no longer needed. So I think first we would like to get
- 20 a sense from you whether you agree with that perspective but
- 21 more broadly I think we would like to get a sense from you
- 22 what role you would like the wholesale markets to play again
- 23 broadly but also in pursuit of the policies that you have.
- 24 We can go down the line or we can take volunteers
- 25 first.

- 1 MR. BENTZ: Well I think I can start maybe on the
- 2 first part of the question. I think the second part as it
- 3 relates to state policies obviously we have Chairs and
- 4 Commissioners here that are going to be able to speak better
- 5 to those individual state policies than NESCOE can
- 6 collectively.
- 7 The question about is entry into the markets only
- 8 going to come from state procurements -- I can say that
- 9 states collectively haven't had much discussion about that.
- 10 I don't know that I would personally buy into that
- 11 perspective.
- 12 Certainly in New England we have some very well
- 13 some very low growth, we have seen it over the last few
- 14 years but we are facing a lot of retirements coming up in
- 15 the next 10 years so you know what we have seen in the last
- 16 3 or 4 FCA's is some big retirements that have opened up the
- 17 ability for new entry to come in.
- 18 And at least in my last 5 years with the state
- 19 prior to that I was on the generator side -- the one thing
- 20 that I know for sure is when you start looking at RFP's for
- 21 out of market contracts, they take a long time. They are
- 22 very transparent, the process is just long -- the approval
- 23 process is long and as we saw in the 3 state RFP there was
- 24 all this expectation that there was going to be these large
- 25 megawatts that are going to come down at the end of the day.

- 1 Yes there's some procurement but it is not as
- 2 large as people had thought originally when the RFP hit the
- 3 street. So I think that you know will all the entry come
- 4 from state procurements? I don't think that is true. I
- 5 just think there will be some retirements to continue to
- 6 have the markets run as they are.
- 7 Will there be quite a bit that comes from state
- 8 procurements? Well we have some RFP's out there. Again
- 9 they are to solicit not to purchase and time will tell
- 10 whether we actually do purchase from those RFP's. Thank
- 11 you.
- 12 MS. HOFMANN: Thank you very much, Sarah Hofmann
- 13 I'm on the Public Service Board in Vermont and I am actually
- 14 speaking for the National Council on Electricity Policy, as
- 15 has already been noted. It also means that I am actually
- 16 speaking for a national group so anything I say is going to
- 17 be wrong for some members of our group.
- 18 But I actually don't see that all entry is going
- 19 to be from state procurements. You know when you look at it
- 20 on the broad spectrum of the entire United States, some
- 21 aren't even in wholesale markets but for those of our
- 22 members who are I think that there is going to be a
- 23 percentage that comes from the state procurement side but
- 24 there still is going to be a role for other wholesale
- 25 purchases because I think we all would generally agree that

- 1 states have benefitted from the wholesale market -- or
- 2 consumers have benefitted from the wholesale market.
- 3 So I can't see it going all the way that way but
- 4 time will tell and we do have very diverse groups and states
- 5 and regions that are not one size fits all.
- 6 MR. QUINN: Thank you, Commissioner Klee?
- 7 MR. KLEE: Hi good morning, Rob Klee,
- 8 Commissioner of Connecticut's Department of Energy and
- 9 Environmental Protection. And on this panel well first of
- 10 all this is my first time at FERC so thank you for having
- 11 me.
- 12 And I probably am the one most suited to dive
- into the policy side because that is our agency. We are a
- 14 merged energy and environment agency and because of that we
- 15 think about our energy choices with the environment in mind.
- 16 And that has led us and our legislature and our governor to
- 17 put in place significant sort of state statutory goals and
- 18 obligations that require delivery of clean, renewable power
- 19 for both our climate change goals and 80% by 2050 reduction
- 20 that's on the books in Connecticut.
- 21 We have our RPS goals -- currently 20% by 2020
- 22 but our legislature has 3 or 4 new options in front of them
- 23 to increase that percentage. And we have our existing -- we
- 24 are also the EPA in Connecticut so we have our existing
- 25 ozone and criteria air pollution standards.

- 1 All of that has led us to use this new outside of
- 2 the market tool of procurements to bring those resources
- 3 because the market wasn't delivering them. The market was
- 4 only delivering one resource -- natural gas.
- 5 And because of that particularly in New England
- 6 where it gets cold in the winter we were having reliability
- 7 problems. So I am actually a fan of the role that states
- 8 can play in bringing diversity of resources and reliability
- 9 of resource into play when the market isn't delivering them.
- 10 That said we still are a fan of markets. We
- 11 believe in markets. We believe that they bring with them
- 12 that ability to drive down prices and get low cost options
- 13 and that's why we are here. We think that these two things
- 14 can co-exist in a way that's effective and efficient.
- 15 It is bringing to the states those things that
- 16 their state legislatures and their governors are demanding
- 17 of them but in a way that is efficient and effective. So we
- 18 think that there will be a mix of opportunity here but right
- 19 now seeing what's coming from the markets we believe that
- 20 there is an important role for the states to play in
- 21 delivering the resources that we are statutorily obligated
- 22 to ensure are there, thank you.
- MS. O'CONNOR: Hi, Chairman LaFleur and
- 24 Commissioner Honorable and Staff thank you for the
- 25 opportunity to be here today. This isn't my first time but

- 1 it is kind of interesting because I'm on a different side of
- 2 the table right now.
- 3 And I guess Massachusetts has demonstrated its
- 4 commitment to markets from the very beginning. We were all
- 5 in on competition, one of the first states to do that and I
- 6 am here to tell you that the administration in Massachusetts
- 7 is still very much committed to that.
- 8 But now let me talk about the 800 pound gorilla
- 9 in the room which is our procurements which were set -- and
- 10 I think that my pre-filed comments really lay out the
- 11 details pretty well in what the legislature has required us
- 12 to do which we will do.
- 13 Also our GWSA and all the same sorts of things
- 14 that Connecticut and some of the other New England states
- 15 are dealing with. But let me turn quickly to the --
- 16 particularly the large scale hydro which gets into the
- 17 accommodate aspect that Commissioner Honorable mentioned.
- 18 You know that large scale hydro is coming. We
- 19 will procure that, the dates are set. We are expecting --
- 20 we will be seeing those contracts as required by statute but
- 21 I guess I would say that New England has done a phenomenal
- 22 job of finding ways to figure out how to accommodate
- 23 wholesale markets and how to work through difficult details.
- 24 And I think we are yet again and I am sorry to
- 25 say this, perhaps the canary in the coal mine because there

- 1 still is a commitment to those markets. While we just
- 2 recently saw what ISO New England has proposed and it would
- 3 be relating directly to the purchase of the large scale
- 4 hydro I suspect.
- 5 The devil is in the details but we are exciting
- 6 about rolling up our sleeves with our fellow states in
- 7 figuring out if that's something that we can do that will
- 8 still allow the markets to function as they should and they
- 9 have provided tremendous benefit.
- 10 I go back in my energy experience to the very
- 11 first electricity contracts and so back with power options
- 12 and north of 100 million dollars of benefit. Sorry Exxon I
- 13 know that's painful. But so they have provided that
- 14 benefit. I still have in Massachusetts right now before our
- 15 siting division there are two power plants that are in that
- 16 siting process so yes, the capacity markets both units have
- 17 cleared in the capacity market.
- 18 So the capacity markets continue to deliver the
- 19 types of units that are needed to maintain reliability. But
- 20 we are at a crossroads and what the legislature requires us
- 21 to do we have to do so the challenge before us, at least in
- 22 New England is how do we marry that and still provide the
- 23 consumer benefits for wholesale markets?
- 24 They were not intended, they are not going to get
- 25 us our large scale hydro or the off-shore wind or frankly

- 1 gas pipelines. But what they have done is provide a
- 2 tremendous amount of detail so I think that for New England
- 3 and I do believe and I appreciate the Commission's
- 4 recognition that it isn't a one size fits all solution.
- 5 But New England has a history of working together
- 6 and I am convinced that perhaps I'm a glass half full kind
- 7 of a person but I am convinced that if we roll up our
- 8 sleeves with the appropriate time and we are looking for the
- 9 support and guidance of the Commission that we can work
- 10 things through the process that is well established in New
- 11 England and look forward to working with everybody to do
- 12 that.
- 13 And thank you very much for the opportunity to be
- 14 here and I am happy to try to answer any questions that were
- 15 not clear in my pre-filed statement.
- MR. SCOTT: Again Bob Scott with the New
- 17 Hampshire Commission and again thank you for putting this
- 18 together. I think this is a very timely and important topic
- 19 obviously. So on the question of would state procurements
- 20 basically allow room for other new entry I think as Mr.
- 21 Bentz mentioned I think the jury is still out on that
- 22 myself.
- 23 When I look at the amount of retirements in New
- 24 England or at risk as you will compared to the amount of on
- 25 the books procurement there seems to be some room left. As

- 1 far as the markets for New Hampshire and this will highlight
- 2 some of the differences among the states and I tried to
- 3 highlight that in my testified is what New Hampshire expects
- 4 out of the markets is to get the benefits of competition, to
- 5 get the best economic result for our rate payers.
- 6 That's a little bit intention obviously with some
- 7 state policies and we look a little bit with trepidation at
- 8 our neighbors to the south of us because obviously they
- 9 impact the market and that's why we are here.
- 10 Having said that I think that factor is in again
- 11 and so another reason why I think the jury is still out is
- 12 there is a cost to these policies and I am not suggesting
- 13 there is not a social benefit and a good reason for the
- 14 legislatures to act but I think understanding the full cost
- 15 to those actions are important to see what happens next.
- And I can't remember Commissioner Honorable or
- 17 Chairman LaFleur mentioned ancillary markets. I'm very
- 18 interested to understand the full dynamics as we move
- 19 forward to hopefully a long-term solution. I think the
- 20 ancillary markets are going to have a much larger role but
- 21 quantifying that and understanding that I think are
- 22 necessary to inform us as states on what we can feel
- 23 comfortable with moving forward.
- 24 So the bottom line is I think the jury is still
- 25 out on new entry and we still hope to harness the

- 1 competitive market to the extent we can.
- 2 MR. MORENOFF: Thank you very much for those
- 3 answers to Arnie's questions. I'm picking up on a couple of
- 4 those responses. Chairman O'Connor you made a reference
- 5 that one of the roles traditionally of the capacity market
- 6 has been the identification of resources that are needed for
- 7 reliability.
- 8 Commissioner Klee had made a similar observation
- 9 with respect to the reliability aspect. Can you talk a
- 10 little bit more about what you see going forward as the
- 11 respective roles of the states and of the RTO and therefore
- 12 more specifically with respect to that reliability aspect of
- 13 the resources that we will need for the future?
- 14 MS. O'CONNOR: Clearly we do rely on the markets
- 15 and ISO regulated by FERC to maintain reliability so that's
- 16 critically important. But we have two dynamics here don't
- 17 we? We have got the legislature saying, "Thou shall" and,
- 18 "we will" and we have got over here markets that are
- 19 designed to maintain reliability.
- 20 So I think it is on the states really -- and I
- 21 appreciate the comments from Commissioner Honorable and
- 22 Chair LaFleur that this is a tough job as a state regulator
- 23 so we have got to look to try to figure out how to balance
- 24 that and I think that's what we have tried to do in the
- 25 process and we are where we are which is we kind of hit a

- 1 pause button and I do think it falls into two different sort
- 2 of markets to accommodate, being the first as I mentioned
- 3 with the large hydro.
- But we have got to find a way to balance that and
- 5 again I feel there is a commitment on the part of
- 6 Massachusetts and the administration to continue to do that
- 7 and to work with the ISO and fellow states and market
- 8 participants to figure that out.
- 9 If I had the answer I'd be on an island somewhere
- 10 right now.
- 11 MR. KLEE: So I would only add and perhaps to
- 12 clarify that our feeling in Connecticut in particular is
- 13 that the state policies and procurements thus far and the
- 14 types of resources that we are seeing go into those
- 15 procurement processes are actually enhancing the regional
- 16 grid and its reliability by bringing those diverse
- 17 resources, particularly with our winter peak problem.
- 18 When you have the ability to bring in hydro,
- 19 wind, other non-gas resource efficiency those are the types
- 20 of things we are seeing bid into our procurements and those
- 21 are all -- our procurement actually, our most recent was
- 22 designed to address the winter reliability problem because
- 23 we weren't getting a solution either from the markets or
- 24 elsewhere to bring in more gas infrastructure.
- 25 And the market is only delivering natural gas

- 1 resources. So in essence that's part of hopefully what I am
- 2 trying to get it is I think that where state procurements
- 3 are actually a value added to the region where they are
- 4 bringing in that diversity and enhancing reliability because
- 5 we definitely don't want to -- we have been lucky to have
- 6 mild winters over the last couple of winters.
- 7 We don't want to go back to the polar vortex
- 8 winters and the impact that that was having throughout our
- 9 New England region. So I think that's again the place where
- 10 we need to find that right balance and how these state
- 11 policies and programs -- which in addition are going to be
- 12 increasing load growth.
- 13 So quite a bit of what we are doing in our
- 14 Governor's Council on Climate Change in Connecticut is
- 15 looking at the future and how we are going to reach that 80%
- 16 by 2050 goal and that's electrification.
- 17 Electrification of our transportation center,
- 18 electrification of our building heating sectors -- that's a
- 19 whole lot of growth that's coming in not to distance future.
- 20 So how are we going to work collaboratively both in the
- 21 state procurements and in the regional market to achieve
- 22 that growth and have that reliable resource there for what
- 23 we are only seeing as a growth in electric demand?
- 24 MR. QUINN: I'll follow-up a little bit on kind
- 25 of a line you drew a little bit and a line that David tried

- 1 to draw. In some of the pre-Conference statements talked
- 2 about when state action and I will interpret this in air
- 3 quotes and not offend anyone by saying legitimate.
- 4 The legitimate state policy phrase was used a lot
- 5 in the pre-Conference comments and I appreciate that it is a
- 6 very loaded term. But in trying to distinguish between the
- 7 things that we should expect the states to do and the things
- 8 that we should expect the wholesale markets to do, one of
- 9 the principals that a couple of the comments laid out was if
- 10 the wholesale markets are designed to go do something like
- 11 resource adequacy or you know, acquire flexibility or
- 12 acquire that winter reliability, maybe they are not doing it
- 13 as well as the state would like.
- 14 But if they are already designed to do that we
- 15 should let the wholesale markets do those things and state
- 16 policy should address those things that the markets aren't
- 17 designed to do like environmental policies.
- 18 And that was a fairly broad or a very stark
- 19 distinction that some of the comments made. I wondered
- 20 whether you all think that that's a reasonable principal
- 21 that we could use as we think about what role the wholesale
- 22 markets have versus what role the states have.
- 23 Do you let the markets do what the markets are
- 24 designed to do and states shouldn't interfere there and then
- 25 where the markets aren't doing something that's a place

- 1 where the Commission should try to accommodate and defer as
- 2 much as possible.
- 3 MS. HOFMANN: Sarah Hofmann. I think one of the
- 4 problems may be in terms of that distinction that you are
- 5 trying to make is that we have -- we cannot tell what our
- 6 legislators do. And so they are going to have policies and
- 7 it doesn't matter what anybody here or any place else says,
- 8 they will have policies that set the stage for what the
- 9 state wants and that's what legislators are for.
- 10 So I'm not sure how that division is going to
- 11 actually work in terms of, kind of drawing a line because
- 12 there is no way to -- I mean when you think about, I'll go
- 13 back to Remady even though I'm speaking nationally I'll use
- 14 it as an example.
- I mean most of our policies are very
- 16 environmentally forward looking in terms of what we want --
- 17 greenhouse gases, renewables, you know all those kinds of
- 18 things that we are trying to address. But at some point it
- 19 does carry over to what kind of resources are procured and
- 20 I'm not sure how we can differentiate along the lines you
- 21 are talking about.
- 22 MR. SCOTT: Thank you. I think ultimately I
- 23 agree with that proposition the way you phrased it. I think
- 24 as a practical matter as just mentioned and I am one of the
- 25 offenders. I have 424 legislators in my state right so the

- 1 good news is that they are all engaged in energy policy.
- 2 The bad news is they are all engaged in energy
- 3 policy. So things can change pretty dynamically but I do
- 4 think you know you resource adequacy, liability is -- should
- 5 be in that purview on the wholesale market.
- 6 A good example New Hampshire is a net exporter of
- 7 energy right so if we are going to try to manage those
- 8 issues at the state level we are really providing energy to
- 9 some of our outlying states so how does that work?
- 10 We have six different states so you would end up
- 11 with a patchwork of things so I think as pragmatically
- 12 because we are not able to control our legislators I think
- 13 pragmatically it would need to be a hybrid approach.
- 14 So some states may want to weigh in from their
- 15 legislatures and say okay we want a subsidy for nuclear
- 16 power for instance, not my state. But that may be something
- 17 they would want to do but I still think ultimately we need
- 18 the backstop at that level to make sure that for all of New
- 19 England we have these needs met.
- 20 MR. KLEE: Thanks Jeff. Just quickly and Bob we
- 21 often don't always see exactly the same way as the folks up
- 22 there in New Hampshire do down in Connecticut. One thing I
- 23 would caution is that the resource mix was always something
- 24 that was -- and the resource mix being determined by the
- 25 state was always part of our deregulation.

- 1 I mean we enacted our RPS at the same time as we
- 2 deregulated so we still sort of believe in Connecticut that
- 3 we retain you know that ultimate sort of choice of what
- 4 types of resources we are seeing coming through RPS and
- 5 through other policies.
- 6 So I just want to sort of Connecticut would
- 7 probably be less on the side of giving up that authority
- 8 than New Hampshire would be.
- 9 MR. BENTZ: Jeff Bentz from NESCOE. I think if
- 10 you try to keep them separate sooner or later there is going
- 11 to be a collision. We have all noted the tension and the
- 12 conflict between state policies and markets and I think it
- 13 is one thing that the process has brought out we have heard
- 14 a lot from however many meetings we had, 7 to 9 meetings
- 15 that everybody is concerned about this tension and this
- 16 conflict and presentation. I would call it a train wreck.
- 17 And I think that if you let them both go down a
- 18 single path sooner or later the markets will unwind
- 19 themselves, I think that's pretty clear. States aren't
- 20 interested in having markets just for the sake of having
- 21 markets that oversupply that would happen if the markets
- 22 took care of reliability and state procurements took care of
- 23 the state requirements you would end up with too much of an
- 24 overbuild.
- 25 So I think maybe that's not in the next 3 to 5

- 1 years but down the road clearly we can see that train wreck
- 2 coming and probably the end of markets as we would know them
- 3 today.
- 4 MR. QUINN: Thank you that's really helpful. So
- 5 I think what we are hearing a little is that there is a
- 6 desire to keep the markets, have them do the job that they
- 7 have traditionally done -- a recognition that the states
- 8 have policies that they would like to pursue.
- 9 I think that the first set of comments I heard a
- 10 little bit of the potential for -- especially given the
- 11 interconnected nature of the markets and the fact that a
- 12 particular state action is kind of necessarily exported a
- 13 bit to the rest of the states in the region that it shares
- 14 an RPO with that there is that possibility for -- if not
- 15 conflict between state policies and the market outcomes
- 16 other states experience it will at least export or
- 17 implications for other states.
- 18 So do you have a view on how if there are
- 19 conflicts, or if states are being affected -- one state is
- 20 being affected by another state in its RTO who's role it is
- 21 to mediate those conflicts, especially as they are
- 22 promulgated through the wholesale markets. Is that a role
- 23 for the Commission?
- 24 If it is not a role just for the Commission how
- 25 do the states and the Commission share that role?

- 1 MS. O'CONNOR: Angela O'Connor from Mass. DPU.
- 2 It cuts both ways doesn't it? I mean I look at the
- 3 investments from and again a lot of that is in my pre-filed
- 4 testimony. We have -- Massachusetts doubled down some years
- 5 ago on energy efficiency when load was like this, it is now
- 6 like this.
- 7 We were 49.5% of the load we are now 46.5% of the
- 8 load. Those investments behind the meter will continue. I
- 9 have the mother of all rate cases in front of me with all
- 10 sorts of interesting tasty little tidbits of behind the
- 11 meter things that include electrification, it includes
- 12 storage, it includes all sorts of things.
- 13 So the world is changing. It is not the same as
- 14 it was. I was you know, first in when I remember
- 15 restructuring of those original contracts but the world has
- 16 changed. And we have a legislature and I appreciate both
- 17 Bob and Sarah talking about the inability to control them.
- 18 That could not be more true than it is in Massachusetts but
- 19 you know we have made a serious and significant financial
- 20 investment. So we do support those markets but we still
- 21 have to make these you know -- we have to do what we have to
- 22 do so if that is in conflict -- and there is going to be
- 23 significant cost to the things that we are doing, we have
- 24 done it before and we are going to continue to make those
- 25 investments.

- But that presents its own sort of a challenge
- 2 within that market structure so are we -- you know the
- 3 Commission has the responsibility of representing rate
- 4 payers here so we have to do -- we have to make these
- 5 procurements and do this at the least cost to rate payers
- 6 which is a tremendous benefit that the markets provided
- 7 with an economic dispatch marble et cetera.
- 8 But they weren't designed to do this so I think
- 9 what we all have to do together is to find a way that we can
- 10 marry them both. I apologize for the redundancy in that
- 11 comment but I don't know another way to describe it.
- 12 MR. KLEE: Hi Rob Klee from Connecticut. I think
- 13 to follow-up on Angie's comment to this specific question of
- 14 when two states are -- their policies or directions are
- 15 potentially in conflict. I think we have demonstrated in
- 16 New England that the first thing that we should do is for
- 17 the states to get together and work together and try to work
- 18 it out and try to resolve conflicts amongst the states
- 19 before asking or going to another entity.
- 20 And we have been successful at that in our
- 21 regional greenhouse gas initiative, RGGI process, through
- 22 IMAPP, through our multi-state procurement RFP's. We can it
- 23 down in a room as co-sovereigns and figure it out which is a
- 24 good thing to do and I think that could help actually avoid
- 25 intervention by the ISO's or FERC to resolve or mitigate

- 1 those conflicts.
- 2 Because I think that we have principles to when
- 3 we approach those conflicts and I think those are important
- 4 to have to make sure that everyone is honored and respected
- 5 in the different positions and different places each of us
- 6 are coming from as states.
- 7 And then be very aware of if and when there is
- 8 potential for costs that might be shifting regionally to
- 9 address that and to be open about it and then allow those to
- 10 be allocated appropriately and we believe the states can
- 11 figure those things out pretty well on their own.
- 12 So I just wanted to sort of say that we have had
- 13 some success and I think we are going to keep working at it
- 14 through the other sort of processes we have been working on
- 15 as well.
- 16 MR. SCOTT: Thank you and I think here's where
- 17 Rob and I do agree. Again RGGE was not an easy thing but
- 18 the states are doing it. A couple concerns obviously my
- 19 opinion is I question whether really a lot of this in the
- 20 different IMAPP proposals revolves around carbon and carbon
- 21 policies.
- 22 I question whether frankly FERC has -- that's in
- 23 their jurisdiction frankly but even within that I think that
- 24 the prospect of not following Rob's advice, not allowing the
- 25 states to figure this out is you are going to end up

- 1 inevitably in a situation where the optics are the federal
- 2 government is forcing a solution on states and there's a
- 3 couple -- many problems with that.
- 4 But one is state policies are dynamic. We just
- 5 talked about legislators so what we have today could change
- 6 tomorrow. Trying to lock that into a federal policy really
- 7 doesn't work and the other thing we haven't really talked
- 8 about here but it is one of the elephants in the room is
- 9 siting.
- 10 So if you are in a world where you need to site
- 11 projects but there is this discontent in states because they
- 12 feel something has been forced on them that takes an already
- 13 almost impossible situation you know again, we have a lot of
- 14 engaged people and makes it even harder to get what we all
- 15 collectively may want to do.
- So I would argue there are a lot of pitfalls to
- 17 that approach even if it were legal and I will leave it at
- 18 that.
- 19 MS. HOFMANN: On behalf of the National Council
- 20 of Electricity Policy I just wanted to echo some of what the
- 21 Commissioners here have said in terms of on a national level
- 22 too. There's a lot of collaboration between the states to
- 23 resolve their differences and I think they have been
- 24 successful not just in New England but in other parts of the
- 25 country from talking to other people on the Executive

- 1 Council for NCEP.
- 2 So I just wanted to echo that in terms of on a
- 3 broader scale.
- 4 MS. SIMLER: Quick question Commissioner Scott I
- 5 would like to follow-up on something I think I heard you say
- 6 about the state policies being dynamic and the potential for
- 7 failure if there was federal policy that locked in state
- 8 policies at a certain time.
- 9 So I'm wondering if instead of as you know
- 10 locking in policies we instead look to principles of what we
- 11 want to accomplish, you know, kind of state level narrowing
- 12 up to the federal level.
- 13 And in someone's filed testimony there was
- 14 comments about minimizing artificial surpluses and
- 15 minimizing excess costs borne by customers and Chair
- 16 O'Connor I think I heard you mention at least the minimizing
- 17 the excess costs to customers.
- 18 So I'm wondering if we could hear a little bit
- 19 about the potential for the common policy objectives that
- 20 may help marry up what's going on at the state level with
- 21 federal and Commissioner Scott if you would like to start.
- 22 MR. SCOTT: I think that is the crux of the
- 23 issue. We are six different states with six different
- 24 policies and again I'll pick on carbon because that really
- 25 is the crux of the discussion. We have RGGI and that's a

- 1 state policy and that's something we are implementing,
- 2 that's something that periodically we review and we are in
- 3 that process right now and so far the last time we did the
- 4 review we strengthened it looking at that again.
- 5 I think it ends there though. The problem is for
- 6 instance especially for my state, my legislature hasn't gone
- 7 beyond that. We have minimal portfolio standards, the
- 8 Commission just enacted last year an energy efficiency
- 9 resource standard so we are in different places but we don't
- 10 have the Massachusetts and Connecticut Global Warming
- 11 Solutions Acts.
- 12 We don't have the Fuel Diversity Act that
- 13 Massachusetts just had so we are at very different places.
- 14 So I agree that we need to marry those so that would argue
- 15 to me whether people like it or not you take the least
- 16 common denominator and that's the group policy but that's
- 17 really RGGI and we are already doing that so it is not a
- 18 perhaps fulfilling answer but I think that's where we are.
- 19 MS. O'CONNOR: I'm not sure there is an easy
- 20 answer to that question because again there is as Bob said
- 21 and Bob and Rob are the experts on RGGI, that's not what my
- 22 office does. But we have done that and there are a number
- 23 of other things that are happening behind the meter.
- 24 But we have the procurements so part of our job
- 25 will be and it will be as I keep saying the devil in the

- 1 details, we see what those contracts look like and the
- 2 procurements. The nice thing is that when you have a party
- 3 and everybody wants to come so I think there's a great deal
- 4 of interest in what Massachusetts is doing whether it is the
- 5 large scale hydro or it's off-shore wind.
- 6 But when we look at that part of our job is to
- 7 look out for rate payers and to do that as economically as
- 8 we possibly can recognizing that those are not insignificant
- 9 purchases.
- 10 But then the flip side of that is -- and it goes
- 11 to the minimum offer price rule because it becomes punitive.
- 12 You know we have to do this by law in Massachusetts so if it
- 13 triggers the minimum offer price rule then that's going to
- 14 be an extraordinary expense to the rate payers of
- 15 Massachusetts now isn't it.
- 16 If it's a firm -- again the devil is in the
- 17 details with a contract but in the particulars of large
- 18 scale hydro it should be a capacity resource. If it is firm
- 19 and that's the way the decisions are made around the
- 20 contracting it should be a capacity resource and it should
- 21 count towards that and our rate payers should not have to
- 22 pay for it twice.
- 23 But how do we do that? And I think that what
- 24 again the devil will be in the details but we will see what
- 25 ISO has come forward with. It is just in the very early

- 1 stages of discussion but I go back to Lycap the musical and
- 2 sat here and talked to the Commissioners at that time about
- 3 you know give us some more time we are going to figure this
- 4 out.
- 5 And was it perfect? No. But did we figure it
- 6 out? Yes we did for that time. But we are at a crossroads
- 7 and the world has shifted yet again in New England. So I
- 8 guess my suggestion is -- is that as a region we need the
- 9 time to sit down with state regulators, to sit with ISO and
- 10 to sit with the other market participants and figure out how
- 11 we can do this.
- 12 MS. SIMLER: Anyone else like to comment?
- 13 MR. MORENOFF: I have a two part question picking
- 14 up on statements that some of you have made. First picking
- 15 up on a statement from Commissioner Scott who said that
- 16 resource adequacy should be in the purview of the wholesale
- 17 markets.
- I was hoping just to go down the line and see do
- 19 each of you agree with that statement.
- 20 Second, to the extent that there is a -- as Sarah
- 21 Hofmann had noted, likely to be some percentage that comes
- 22 from the wholesale market and some percentage that comes
- 23 from state procurement. To what extent does the larger
- 24 degree of the -- as the percentage of state procurement
- 25 becomes larger, how does that affect the role of resource

- 1 adequacy in the wholesale market?
- 2 But the first part is just down the line
- 3 commenting on Commissioner Scott's statement.
- 4 MS. O'CONNOR: I do think resource adequacy
- 5 should -- of the state at least in Massachusetts we are not
- 6 looking to take that back thank you very much. But it does
- 7 present that challenging dynamic so I do still think that it
- 8 does belong there and I'm sorry for the second part of your
- 9 question, my flight was delayed last night I'm tired.
- 10 MR. MORENOFF: I think you may have picked up on
- 11 also the second part of the question would be does the
- 12 larger degree -- as the percentage of resources coming from
- 13 state procurement increases how does that affect the world
- 14 -- the wholesale markets with respect to resource adequacy?
- 15 MS. O'CONNOR: You are channeling your inner Jeff
- 16 Bentz. So we have the legislative mandates -- again that's
- 17 all laid out in my pre-filed testimony. I mean ultimately
- 18 the hope will be once we get past that that if we are able
- 19 to create a market mechanism so instead of the legislature
- 20 saying, "Thou shall," hold on you know if we want to procure
- 21 this is there a way whether it is demand bids and I'll turn
- 22 it over to Jeff to talk in maybe more detail about some of
- 23 these other conversations.
- 24 Because if we are able to use that, ultimately
- 25 that would be the best thing. I mean forgive me for wanting

- 1 my cake and eat it too because we have to do these
- 2 procurements but if we are able further down the road that
- 3 within the markets of New England that we are able to have a
- 4 mechanism that allows competition.
- 5 You know, here's what we need and then allows
- 6 folks to bid for it. I mean the best possible result is
- 7 that you have multiple entities pursuing what it is that we
- 8 need. That would be the best case scenario and hopefully
- 9 again there is no -- you can't control the legislature but
- 10 if we can demonstrate to the legislature that we have worked
- 11 and then you know going forward there is this mechanism and
- 12 maybe stop the world of RFP's and these types of
- 13 procurements and find another way to do it within the
- 14 market would be ideal.
- 15 MR. KLEE: So that actually made a whole lot of
- 16 sense to me which is a little scary. Just in full
- 17 disclosure I'm probably the least in the leads amongst the
- 18 group here but that did make sense particularly on the need
- 19 to sort of evolve over time to that future state while
- 20 recognizing our current state and our current legislative
- 21 mandates that you have in Massachusetts, we have here in
- 22 Connecticut as well and the fundamental roles of the ISO.
- 23 And the things that ISO does well and delivers in
- 24 the safe, reliable you know complex system that is managed
- 25 and is delivering you know, power each and every day. I

- 1 mean those are all the things we want to and I think
- 2 actually Miss Simler it goes back to your sort of question.
- 3 The sort of fundamental principles upon which we
- 4 all can agree that the things that we want to have delivered
- 5 by our grid, delivered by ISO and respected in terms of what
- 6 the rate payers are not double-paying or over-paying for
- 7 resources and what not.
- 8 So I think that keeping those fundamental
- 9 principles, having those out in the forefront and then
- 10 having the system evolve to recognize what has come forth
- 11 from our independent legislatures that have been directing
- 12 us to do certain things and then I do like the idea of that
- 13 opportunity in the future where we can point to to say hey
- 14 if you want those sorts of resources here's the mechanism
- 15 that will be able to deliver them to you in ways that you
- 16 are comfortable with in terms of cost to rate payers and
- 17 getting the most efficient and the most effective in terms
- 18 of our other and effectuating our state policy goals and our
- 19 significant ones, particularly around climate.
- 20 MS. HOFMANN: Sarah Hofmann, National Council on
- 21 Electricity Policy. I think that as a general principle
- 22 resource adequacy is in the purview of the wholesale markets
- 23 but obviously things are changing and that's why we are
- 24 having this conversation.
- 25 I want to thank FERC for actually deciding that

- 1 you need to have this collaborative discussion and that is
- 2 happening at ISO New England in a big way. It's happening
- 3 at other ISO's and RTO's as well and that is really you just
- 4 kind of named the whole crux of the problem.
- 5 How are we going to integrate this as state
- 6 procurements get bigger without making the market useless or
- 7 not really doing its function? Because I do think it has
- 8 this function and has benefitted rate payers greatly so our
- 9 challenge is how do you marry the two?
- 10 MR. BENTZ: Jeff Bentz from NESCOE and since we
- 11 speak collectively for the states what they said that keeps
- 12 me out of trouble at home too. I will say those as far as
- 13 involvement all six New England states have been very
- 14 involved in the IMAPP process -- that's what this process
- 15 was about when it started.
- 16 NESCOE was very clear what we wanted to see out
- 17 of the IMAPP process was a possible mechanism that we could
- 18 all employ to better integrate policies and markets.
- 19 Because as I have explained it to the IMAPP group you know
- 20 the states have different pasts and create a CES and create
- 21 RPS, this path and that path but the one path that we have
- 22 never had because of the MOPR was a really competitive
- 23 market path.
- 24 And I do want to give credit on behalf of NESCOE
- 25 to all the participants in the IMAPP process. They brought

- 1 together a lot of good proposals. They have given us a lot
- 2 of stuff to think about. We now have the ISO New England
- 3 proposal so I can't really answer your first question other
- 4 than to say that all the states have been -- state
- 5 representatives have been at all the IMAPP meetings we have
- 6 had plenty of collective discussions among the states.
- 7 But there is conflict and to go back to your
- 8 earlier question that started this you know should the FERC
- 9 get involved in trying to settle those conflicts I can tell
- 10 you as NESCOE that's what we do and good luck.
- 11 But I do appreciate all the Commissioner's
- 12 comments. We have a good history of working together
- 13 resolving those conflicts and I think from a FERC standpoint
- 14 writing rules to settle those conflicts would be very
- 15 difficult.
- We have a saying in New England is whack a mole
- 17 sometimes you fix one thing and you know three more pop up
- 18 and I think if the FERC were to try to get involved in
- 19 settling state conflicts you could see that come up.
- 20 MR. QUINN: At this point I'll ask the
- 21 Commissioners whether they have got any questions for our
- 22 panelists.
- 23 COMMISSIONER LA FLEUR: This has been a great
- 24 panel. I'm just trying to unpack what you said and kind of
- 25 go around the merry go round here. So the first thing we

- 1 heard was that people in general still want the centralized
- 2 market to play some role in bringing in resources for
- 3 liability and sustaining existing resources for reliability
- 4 I presume since that's part of what keeps the lights on.
- 5 In fact it is most of what keeps the lights on
- 6 right now but that will change over time. So no one said no
- 7 we are going to take over buying all the resources at the
- 8 state level, we don't want the market to call for any so on
- 9 the one hand that felt good for the first five minutes but
- 10 then it made me realize well then we have to figure out how
- 11 to sustain a just and reasonable price in that market for
- 12 the existing resources that were built into the market and
- 13 are there now and for new resources that might be needed
- 14 that are not going to be procured by the state because they
- 15 are not the favored technology.
- 16 So that brought me around -- there was a very
- 17 strong theme in the comments and I am just going to be real
- 18 blunt and call it out which was a kind of lack of trust of
- 19 FERC solutions. Because one thing the economists would say
- 20 is okay figure out what the states one, define it. When you
- 21 define it you can price it. But it came through loud and
- 22 clear, don't do that please.
- 23 Whatever you do, don't figure out what our state
- 24 laws add up to and price it in the market, we don't want a
- 25 FERC plan that was pretty clear. So where does that -- that

- 1 kind of crosses the achieve off the table at least if you
- 2 take it all the way.
- 3 So that leads us around to if we have to protect
- 4 a just and reasonable price and you don't want us to
- 5 redesign the market for what you want, then we probably have
- 6 to do what you don't want and somehow do a double price
- 7 curve for the unsubsidized resources, or a minimum offer
- 8 price rule or something to protect that price, that you
- 9 still want us to protect because you don't want to buy
- 10 those other resources.
- 11 So we are kind of going around the curve and I
- 12 know you don't want that, that also came through loud and
- 13 clear so now we are back to the beginning. So the ISO New
- 14 England solution to me is a phase step toward the market
- 15 getting out of resource adequacy because all of the new
- 16 resources come in unless there is a cap to what the states
- 17 want.
- 18 But if Massachusetts want's 80% clean I mean
- 19 that's a pretty big cap, that's a small market. So is that
- 20 the solution to kind of weed us off this where every year
- 21 you would buy a little more and the market would price a
- 22 little less and more things would retire or do you see a
- 23 long-term non-state market in which case we have to figure
- 24 out a price for it no matter how hard it is.
- 25 And this is the kind of -- my mind has been going

- 1 in this curve for a long time so help me.
- 2 MR. BENTZ: It's great to be me. So thank you
- 3 Chair LaFleur. I did hear you say you know accomplish isn't
- 4 a goal and I want to push back a little bit and say no, I
- 5 hope you are not hearing that.
- I know that I have heard collectively from the
- 7 states that some of the "accomplished" proposals that have
- 8 been put out at IMAPP are something that we want to continue
- 9 to look into. NESCOE is doing a mechanism study.
- 10 We are actually going to look at some of those
- 11 proposals in that study. And I can state from some of our
- 12 collective discussions you know there is a lot of value in
- 13 having ISO run markets just you know, qualifying capacity,
- 14 the transmission constraints, they have the people to do it,
- 15 the engineer to do it.
- So that's one of the things that the states are
- 17 looking at so I do want to push back that I think there are
- 18 some proposals out there.
- 19 COMMISSIONER LA FLEUR: So it's just carbon
- 20 pricing you don't want. Other things are still okay?
- 21 MR. BENTZ: I think the states have been pretty
- 22 clear on the carbon pricing proposals. I think that it is
- 23 more than just -- I'm going to use your words, so it is not
- 24 my words, the trust issue. I think that is a big one. I
- 25 think that came through loud and clear in our April 7th

- 1 memo. But I also think there were six or seven other
- 2 reasons in there, cost clearly being one of them.
- 3 Certainly what we have seen in New England
- 4 through the IMAPP discussions and also through the NESCOE
- 5 study that we just published, New England has a pretty flat
- 6 supply curve and so pricing carbon in New England probably
- 7 is not going to give you the carbon benefits that it might
- 8 in other regions.
- 9 So I don't want to say that carbon is just bad
- 10 everywhere, but in New England given our current supply
- 11 curve I don't know that we will get much carbon benefits so
- 12 from a consumer perspective if I look at the number of clean
- 13 energy megawatts that are produced today and I take the time
- 14 to say a \$10.00 per megawatt carbon price, that's a half a
- 15 billion dollars.
- And I'm not sure the supply stack is going to
- 17 change. At least no one has been able to prove that to us
- 18 through the IMAPP process. So I want to say that as far as
- 19 carbon goes, it's not just trust there were quite a few
- 20 other reasons.
- 21 COMMISSIONER LA FLEUR: But do you think there is
- 22 a way to define what the states want and price it? I mean
- 23 if it is not carbon and I do understand that -- I mean or do
- 24 the states want by the very definition the ability to choose
- 25 which means even if we could somehow put an attribute on it

- 1 and ask Gordon Van Wiley to run an auction to price it, it
- 2 wouldn't come out with the specific thing you want.
- 3 Because if it is the specific thing then I think
- 4 we are at accommodate because the market might not -- I mean
- 5 I think it would take a genius to back design the market to
- 6 come up with this much off-shore wind and this much that,
- 7 and this much that. Definitely -- so should we be trying
- 8 for that attribute or is it -- should we just be trying to
- 9 protect the price of everything else and let you run with
- 10 your market?
- 11 MR. BENTZ: Jeff Bentz from NESCOE. Excellent
- 12 question one that has been asked really early in the IMAPP
- 13 process. One that if you look at our April 7th memo we have
- 14 basically said to NEPOOL we get that question, we have to
- 15 answer it. That ball is in our court. We understand it is
- 16 very important because you can't get economists to go design
- 17 something without a good goal.
- 18 So that is in the state's court. We are
- 19 continuing to meet on that issue. One thing that we have
- 20 talked about both openly at IMAPP and collectively at our
- 21 state meetings is you know maybe we don't get 100% of the
- 22 way there. Maybe we can only achieve 70% of what we want
- 23 because as the Commissioners have said the legislature is
- 24 always going to do what it is going to do and maybe there is
- 25 some 30% that stays out of the market, outside the market.

- But is that a success if you get 70%? I kind of
- 2 think so personally. So it is a goal that we haven't
- 3 dropped at the state level yet.
- 4 COMMISSIONER LA FLEUR: Okay I have to ask this
- 5 question even though I think I know what the answer is going
- 6 to be. I just want to ask a question about RGGI. Do you
- 7 know we have folks on the hill who have been watching the
- 8 IMAPP process saying, "Why don't they use RGGI?" RGGI was
- 9 designed to do this. RGGI is to get clean energy. It
- 10 already exists it's controlled by the states not FERC. I
- 11 think there are ways you could you know, design it to allow
- 12 for different state policies if you wanted to you know and
- 13 let things separate if you had just a couple of states that
- 14 want to do it a different way.
- 15 But yet every time -- I mean on the face of it it
- 16 looks like it was designed to do what the states are trying
- 17 to do which is meet those stair step carbon goals. So is
- 18 that -- are we just barking up the wrong tree or does RGGI
- 19 have a role in getting us to do part of the job or none of
- 20 the job or if not what is it for?
- 21 MR. SCOTT: Sure, thanks for that question and
- 22 you may remember this Chair LaFleur is at the very beginning
- 23 of this process for NEPOOL my recollection is that's what a
- 24 lot of the participants said well just obviously there is a
- 25 mechanism -- you have RGGI, just make RGGI a lot more

- 1 stringent and that will be your answer.
- 2 In a vacuum I don't disagree with any of that
- 3 because the reality is as you know is RGGI is 9 states, each
- 4 state gets a vote and it is not just a vote it is -- we all
- 5 have to unanimously agree.
- 6 And what's needed for RGGI -- the allowance price
- 7 for RGGI to do what the market is now and that's just what
- 8 Connecticut policies are fully engaged in is at this point
- 9 is not practical for all of the states to do.
- 10 So we are negotiating behind the scenes how far
- 11 we go on RGGI. One thing I think I can say is nobody is
- 12 anticipating going that far right now with RGGI. So that as
- 13 a case in point of going back to the carbon matter what a
- 14 lot of people are suggesting to us is okay states -- you are
- 15 saying it is a non-starter to do that and RGGI for whatever
- 16 word you want to use practical -- political, whatever.
- 17 And the suggestion that then instead we will do
- 18 it for the federal market -- if you think about what that
- 19 just said the states agreed we can't do this at this
- 20 juncture but yet we will try to do it at the federal market,
- 21 how does that work?
- 22 So that's the conundrum if you will, RGGI is the
- 23 right answer I agree.
- 24 COMMISSIONER LA FLEUR: Whether it was RGGI or
- 25 something else. If want you wanted was the most carbon

- 1 improvement -- the cheapest, some structure would get you
- 2 there. So if what you really want -- if the problem is whoa
- 3 it has to be a really high price to bring off-shore wind or
- 4 whatever it is we want, then that means you want to select
- 5 the specific resource.
- I mean I just want to understand what you want
- 7 because if we -- the worst thing I want is to come up with
- 8 some God forbid, may I say brilliant solution, but it is not
- 9 what you want because it doesn't produce.
- 10 So if you really want to choose that's different
- 11 than wanting clean. It's -- they might be clean things but
- 12 you want to choose specific, at least some states it sounds
- 13 like.
- 14 MR. SCOTT: And to finish my statement what I
- 15 want is not to pay for Massachusetts and Connecticut's
- 16 policies bluntly. So that shows you the dynamic there.
- 17 MR. KLEE: And I think Bob, I will agree with you
- 18 there actually, which is a surprise. But because one of the
- 19 things we have learned through RGGI and one of the things
- 20 that my Governor and other Governors are laser focused on
- 21 with RGGI is the fact that it is a 9 state collaborative
- 22 with a process that has to bring all of us together in
- 23 consensus.
- 24 And one of the main goals of all the members
- 25 right now is to keep the band together and to keep RGGI

- 1 together and to do that in a way that respects the varying
- 2 places where all of our states are coming from.
- 3 And that has a parallel in New England. We are
- 4 in different places in southern New England with our
- 5 legislative enactments that are pushing hard and sometimes
- 6 on individual resources but not always.
- 7 I mean our procurements have for the most part
- 8 been open to all Class 1 resources. We compete different
- 9 resources against each other, that's the way the Connecticut
- 10 way is a different way than Massachusetts. But again we
- 11 need something that respects those different approaches and
- 12 each state's sovereign right to have those approaches.
- 13 The last thing on RGGI obviously is that it is 9
- 14 states in three different ISO's and not all of those states
- 15 are the entirety of their ISO like we are in New England,
- 16 another concern that some may have about RGGI as a solution.
- 17 COMMISSIONER HONORABLE: I'll make a quick
- 18 comment and then I will ask Commissioner Scott I want to
- 19 follow-up on something that you mentioned earlier. I
- 20 appreciate this panel because you have teed up nicely the
- 21 larger tensions that we are facing.
- 22 And I know you. I've come from where you are now
- 23 and I understand you and I also sympathize with you. You
- 24 are trying to thread a needle that you found in a haystack
- 25 and it is a sewing needle and you have got to thread it with

- 1 wool yarn and you are sitting precisely between very active
- 2 legislatures and I hope that you shared this message with
- 3 them.
- 4 We couldn't possibly control them nor do we want
- 5 to. And then we sit in this unique place of trying to
- 6 protect markets which have been not perfectly operating as
- 7 intended and not -- and we too can't be controlled by
- 8 individual legislatures.
- 9 But I think that we all have demonstrated really
- 10 quite passionately and eloquently our willingness to invest
- 11 in this and be hopeful as Angela said about where we are
- 12 headed for the future and how we do that in a way that
- 13 appreciates your respective states goals.
- 14 You are very active and we will hear from New
- 15 York and others about their activity. It's a beautiful
- 16 thing, it's a challenging thing. And we have also managed
- 17 to touch on in less than an hour what's at the heart of
- 18 this, its trust.
- 19 And you guys have teed up to your faith journey
- 20 with one another but I am hopeful that we can continue and I
- 21 have often said so much of our work depends upon our ability
- 22 to trust one another and work well together. You all have
- 23 demonstrated that with your RGGI effort though Rob has
- 24 eloquently stated it doesn't represent the entirety of the
- 25 three regions.

- 1 And I look forward to our work together, even in
- 2 my time but more broadly the Commission's work with you to
- 3 help you achieve your goals while attempting to accommodate
- 4 them in markets.
- 5 So let me get to my question I know we want to
- 6 stay on time. Bob and I should say Commissioner Scott for
- 7 the record, you mentioned earlier but you touched on it
- 8 briefly and I wanted to ask you to elaborate on it just for
- 9 clarify in our record -- a trepidation you have about
- 10 activity to the south of where you are.
- 11 I wanted to ask you to touch on that a bit and
- 12 what are the market concerns you might have about that.
- 13 It's a loaded last one isn't it?
- 14 MR. SCOTT: Well I love my neighbors to the south
- 15 let me go on record for that. Really it goes back to the
- 16 off-hand quip I made the concern we have -- I'll speak for
- 17 New Hampshire. Right now there are a lot of concerns about
- 18 rates and it is not such that the rates are so high in New
- 19 Hampshire and New England absolutely but it is really
- 20 compared to other regions right.
- 21 So our industry spends a lot of time concerned
- 22 about that and there is a lot of concerns about are they
- 23 going to leave the region, that type of thing. So that's
- 24 the context of a lot of this so -- and again good for them
- 25 and they are very laudable goals that the states to the

- 1 south of us have passed as I mentioned.
- 2 The concern is what's the economic impact to a
- 3 state that the legislature didn't take those actions right?
- 4 So one of the reasons why I'm here and IMAPPED and I
- 5 participate in NESCOE regarding IMAPP is we do recognize --
- 6 I do recognize that whether we have a policy or not their
- 7 state policies and they drive most of the load in New
- 8 England, they distort the market right.
- 9 So those distortions have some impact to the rate
- 10 payers of my state. So that's the variance that I am
- 11 interested in dealing with. How can we mitigate that? So I
- 12 am less interested though -- again my legislature tomorrow
- 13 could do the same thing who knows but we are not there at
- 14 the moment. So that's my interest if that makes sense is
- 15 there is an impact, how do we mitigate that and how do we
- 16 maintain the benefits of a competitive market which I know
- 17 FERC shares also.
- 18 COMMISSIONER HONORABLE: And I certainly wanted
- 19 to open it up and that's my only question but if anyone else
- 20 has any thoughts to share, yes Angie?
- 21 MS. O'CONNOR: But you also benefit from some of
- 22 the things that we do with flattening that load curve so it
- 23 does cut both ways.
- 24 MR. KLEE: And our improvements to winter
- 25 reliability as well so.

- 1 MS. O'CONNOR: But I also wanted to add that one
- 2 of the things we did as a region, now I'm speaking as not as
- 3 the National Council of Electricity Policy, is we did make
- 4 principles up, what we were interested in and what our final
- 5 outcome would be.
- 6 And it was one of the principles was not have
- 7 states pay for other state's public policies and we have
- 8 been very respectful of that throughout the process.
- 9 MR. BENTZ: And I'll just add at least -- Jeff
- 10 Bentz from NESCOE -- when the MOPR came out I think I was
- 11 here for the capacity market technical conference and a lot
- 12 of talk about renewables.
- 13 You know we see that the six states did see that
- 14 as a way to accommodate if you will policies in the markets
- 15 and we wrote that to be very narrowed and very tailored to
- 16 help protect the markets and then you know as the policies
- 17 continued to grow I guess we can debate and question whether
- 18 that exemption needs to grow a little bit, at least maybe by
- 19 definition because the definitions change, maybe the
- 20 megawatts don't need to change, but we did come together and
- 21 view that as a way to help accommodate certain state's
- 22 priorities without harming the market.
- 23 And I'm sure a lot of debate about whether it
- 24 harms the market or not but it has been in place for three
- 25 years, we have had three really good options, we have had

- 1 new entry clearing all three options the first two being gas
- 2 turbines. I think the last one only being energy efficiency
- 3 but we have seen new clear where that renewable exemption in
- 4 place.
- 5 COMMISSIONER HONORABLE: Thank you all and Sarah
- 6 your comments really harken back to something Jaime asked
- 7 about and that will be a takeaway for me to really think
- 8 about how you develop those principles and how they could
- 9 really aid a regional effort, thank you all.
- 10 MR. QUINN: Thank you for your frank comments.
- 11 We are going to move you off of the hot seat and move you to
- 12 the warm seats and ask our second panel to come up, thank
- 13 you.
- 14 (Pause.)
- 15 MR. QUINN: Alright we are going to get this
- 16 panel going. We'd like to try to keep as much on time as
- 17 possible. So reluctant sitters your last panelist is --
- 18 alright thank you. I want to thank our panelists again and
- 19 I'll briefly introduce them.
- 20 We have Matthew White who is the Chief Economist
- 21 at New England. We have David Patton who is the President
- 22 of the Potomac Economics.
- 23 We have Brian Forshaw who is the Principal at
- 24 Energy Market LLC speaking on behalf of the Connecticut
- 25 Municipal Electric Energy Cooperative, the New Hampshire

- 1 Electric Cooperative and Vermont Public Power Supply
- 2 Authority.
- 3 We have Peter Fuller who is the Vice President of
- 4 Market and Regulatory Affairs at NRG. We have Seth Kaplan
- 5 who is the Senior Manager of Regional Government Affairs for
- 6 EDP Renewables also speaking on behalf of RENEW Northeast.
- 7 Tom Kaslow, speaking on behalf of NEPOOL. We
- 8 have Aleksandar Mitreski, Senior Director of Regulatory
- 9 Affairs at Brookfield Renewables and finally we have Bill
- 10 Murray who is a Senior Policy Director at Dominion
- 11 Resources.
- 12 Again thank you all for joining us today. Thank
- 13 you for your pre-Conference statements. We have a whole
- 14 stakeholder panel to cover a little of the same ground we
- 15 covered with the states, particularly I would like to
- 16 explore the role of the wholesale markets generally in light
- 17 of state policies but also in pursuit of those state
- 18 policies but also for this panel I would like to explore a
- 19 little bit more the implication of those policies on the
- 20 wholesale markets and the decision-making that the market
- 21 participants are attempting to do.
- 22 We spent some time at the last panel talking
- 23 about the relative role of the state in addressing resource
- 24 adequacy and procuring the resources, especially new
- 25 resources versus the market's role in getting those

- 1 resources.
- I think what I heard was a state's desire to
- 3 continue to have the wholesale market be the place where
- 4 resource adequacy occurs. But at the very end of that panel
- 5 we had the discussion a little bit about maybe what the
- 6 tipping point is regarding when the amount of procurement
- 7 coming through the states starts to make the remaining role
- 8 of resource adequacy for the market more difficult.
- 9 And so I think I would like to start there on
- 10 this panel and ask all of you what you think the relative
- 11 role of the states in the market is in addressing resource
- 12 adequacy and particularly if you see a diminished role for
- 13 the RTO and as you are giving us an answer to that --
- 14 particularly focus on how important it is to have that role
- 15 defined whether it is the state or the market.
- 16 How is that important to the decisions you make
- 17 and how well the market functions?
- 18 MR. MURRAY: Bill Murray with Dominion and I will
- 19 lead off to the extent you think of gas as a rough proxy for
- 20 the market and I think that's a fair approximation. If you
- 21 look at the New England market from the time markets were
- 22 restructured in various states to now I think it would be
- 23 hard to say that gas has become less central a resource.
- 24 If anything the region has become substantially
- 25 more dependent on gas and I think it makes sense to step

- 1 back and look at the world as we saw it in energy when
- 2 markets were restructured. We assumed the existence of base
- 3 load coal -- that's not a good assumption anymore.
- 4 We assumed a nuclear renaissance which has proven
- 5 to be a debatable assumption. I would say even the most
- 6 ardent proponent of solar energy in the room probably is
- 7 surprised by the degree of the deployment of large scale
- 8 solar energy and some of it is rooftop solar energy and not
- 9 -- if anybody here saw the shale gas revolution coming
- 10 somebody earlier referenced why you are not on your private
- 11 island and why you are here today with us in D.C.
- 12 So the world has changed substantially. What I
- 13 don't think has changed is that gas is sort of at the margin
- 14 and if anything it is only going to become significantly
- 15 more gas dependent without necessarily the corresponding
- 16 increases in natural gas infrastructure.
- 17 At Dominion we actually like natural gas for a
- 18 major, major natural gas mid-stream developer but we don't
- 19 think it is smart to rely only on one resource so we think
- 20 appropriately and when a major natural gas midstream
- 21 developer tells you it is not smart to rely on any one
- 22 resource, you know that that may have some salience so we
- 23 think that states appropriately are stepping in to look at
- 24 not just resource adequacy but resource diversity and other
- 25 attributes besides just energy and that is carbon and

- 1 renewables and those are not one and the same.
- I think because RPS's tend to get set up at a
- 3 time when no one was thinking about a national conversation
- 4 on carbon constraints, those are imperfectly designed in
- 5 various state RPS's and now what you see are states stepping
- 6 up with separate or companion climate policies so we have to
- 7 sort of think of not just the energy markets but also carbon
- 8 and renewables.
- 9 But I certainly don't see us at any sort of
- 10 tipping point if anything quite the contrary.
- 11 MR. MITRESKI: Thank you good morning everyone.
- 12 Commissioner LaFleur, Commissioner Honorable and Arnie thank
- 13 you everyone for organizing this wonderful Conference. I
- 14 think everyone is looking forward to discussing this very
- 15 prevalent topic right now and looking forward to hearing
- 16 some opposite interesting ideas and views from different
- 17 perspectives so thank you for that.
- 18 From Brookfield Renewables perspective we are one
- 19 of the largest renewable companies in North America, about
- 20 1100 megawatts of generation of which 88% is hydro so I just
- 21 wanted to kind of put that as a perspective, but we are very
- 22 much a big supporter of the wholesale market itself.
- 23 A very, very small subset of our resources
- 24 receive out of market revenues, so we rely on the revenues
- 25 and the health and the sanctity of the wholesale markets.

- 1 With that said we also sustain support of public policy
- 2 initiatives and goals and believe that the states have the
- 3 rights to pursue those goals. We are very much in support
- 4 of those.
- 5 I do think that it will be short-sighted if these
- 6 two elements are not integrated. I think the markets and
- 7 public policies have been operating sort of in a vacuum on a
- 8 standalone basis but it is coming to a point now when we are
- 9 reaching sort of the landmark years of 2020, 2025 and so on
- 10 where sizable procurements will happen.
- 11 And I think what is very important to keep in
- 12 mind is consumer cost and making sure the consumers do not
- 13 pay twice. Maybe I will just illustrate this as an example
- 14 -- if I own a bakery in the neighborhood and let's say that
- 15 baker is also hydro in Maine and a bakery moves next door
- 16 and it's perhaps a wind facility -- I don't think it's the
- 17 right place or location to implement that type of a
- 18 facility.
- 19 Likewise where I am going with that example is
- 20 that the markets, the wholesale markets, do an excellent job
- 21 of sending the price signals where and when certain
- 22 resources need to come in. And I think integrating those
- 23 will ensure that that wind facility that is needed to meet
- 24 public policy maybe put in a better position on the system
- 25 and not interfere with the hydro or other renewable

- 1 policies because that will be counter intuitive.
- 2 So from our perspective I think the time is right
- 3 to integrate public policy wholesale markets.
- 4 MR. KASLOW: Thanks, Tom Kaslow I'm here as the
- 5 Chairman of the New England Power Pool and I also wanted to
- 6 thank the Commissioners and staff for inviting NEPOOL here
- 7 to make a few comments.
- 8 I also want to thank the prior panel for the
- 9 multiple compliments on the NEPOOL integration of markets
- 10 and public policy initiative. Certainly that's something
- 11 that our region and NEPOOL has tried to be at the forefront
- 12 of these discussions.
- 13 We recognized a lot of the issues that the
- 14 Commission has identified and we started a process almost a
- 15 year ago so about a year into our process. I think with
- 16 respect to the specific question our focus has really been
- on how do we avoid the tipping point right?
- 18 If there are solutions that can accommodate or
- 19 achieve state policy through the markets then perhaps the
- 20 tipping point isn't the question as much as how we address
- 21 avoiding it. And we represent 450 members. We have a lot
- 22 of different perspectives.
- 23 We have some of them on this panel. There are
- 24 about 17 proposals that have been made within our processes
- 25 -- I'm sure you will hear about all of them in the comments

- 1 following the Technical Conference. But I think the real
- 2 key takeaway from a NEPOOL perspective is we are working on
- 3 this as a region. We do have a lot of proposals. We have
- 4 the active engagement of the states. We have the active
- 5 engagement of your staff and I think from our perspective we
- 6 would like the opportunity to find a way to avoid that
- 7 tipping point, thank you.
- 8 MR. KAPLAN: Good morning Seth Kaplan, EDP
- 9 Renewables and RENEW Northeast. And I would just pick up on
- 10 some of the historical perspectives that Bill started with.
- 11 You know at the time that these markets -- and also I think
- 12 the reason to think about the history is to distinguish
- 13 between markets in the abstract and the exact markets that
- 14 we have gotten used to and that we have all built in the
- 15 past.
- 16 The energy markets as we know them were
- 17 constructed with gas turbines in mind. Initially simply
- 18 turbines and then moving more toward combined cycle. And
- 19 the market design was shaped by the technology. We are
- 20 increasingly moving in the case of my company was built all
- 21 around the world -- we built a lot of in North America
- 22 resources that have no fuel price, that have large capital
- 23 cost and that the way you build them is by taking advantage
- 24 of the customer value that flows from having certainty what
- 25 the production cost will be 10, 20, 30 years in the future.

- 1 You know the markets quite simply were not
- 2 designed with these kinds of resources in mind so it is not
- 3 surprising that the square peg doesn't fit into the round
- 4 hole. You know and it is very legitimate for the states to
- 5 want to get the environmental and the economic value of
- 6 these resources. So therefore the task at hand
- 7 is to you know, as we have all been saying re-design the
- 8 markets and you know get out a drill and reshape the hole in
- 9 order to be able to accommodate the resources that are on
- 10 the table in front of us.
- I would take note of the fact that this
- 12 Commission has other tools. You know as somebody who has
- 13 been working to try to build Aleksandar, who seems to have
- 14 characterized this bakery across the street as someone who
- 15 has been trying to build wind in Maine since before the Red
- 16 Sox won the World Series for the first time.
- 17 I would note that you know we have projects that
- 18 had contracts with the state of Connecticut that were ready
- 19 to go and the only thing I can tell you from my unique
- 20 perspective on this that foiled that was transmission.
- 21 And the fact that you know that the ISO New
- 22 England transmission planning process and the cost
- 23 allocation process and a variety of things with over on the
- 24 transmission side of this Commission's jurisdiction has
- 25 frustrated the implementation of those state goals is a very

- 1 real thing.
- 2 And that we must understand the need for the
- 3 Commission to use all of its tools to both assist the states
- 4 in reaching its goals in the least cost way and to move the
- 5 markets forward in an efficient way. You know at the end of
- 6 the day it is about cooperative federalism. It is about
- 7 comedy. It is about designing to accommodate the state
- 8 policies to deal with the reality that as the courts have
- 9 said inevitably state policy is going to affect wholesale
- 10 prices.
- 11 The states don't have the right to set wholesale
- 12 prices but the states have the inherent ability through
- 13 their actions to affect them and to figure out how to set
- 14 that balance and to design the wholesale markets in a way
- 15 that accommodates those state policies and that recognizes
- 16 that reality that the states are going to affect them.
- 17 Now it won't be easy and we need to have some
- 18 faith that as we have set up a good market design there will
- 19 be more storage, there will be more technologies that can
- 20 respond to the market signals.
- 21 MR. FULLER: Good morning Pete Fuller with NRG.
- 22 First of all Chairman LaFleur, Commissioner Honorable thank
- 23 you very much and thank you to the staff for putting on this
- 24 very timely and very important effort.
- 25 I actually want to pick up with a point that Seth

- 1 raised and I think it's important to keep in mind this is
- 2 sort of the third "A" in our AAA series here of accommodate,
- 3 achieve and adapt.
- 4 We need to be thinking about that world where the
- 5 grid is primarily powered by renewables by intermittence, by
- 6 variable resources -- however you think of it. We need to
- 7 be thinking about that as a different paradigm than the
- 8 fossil fuel input heat raid world that we have dealt with
- 9 for the past century or so.
- 10 We need to think about what new products are
- 11 going to be necessary, how does that work in a market
- 12 construct and I don't start with that because it's what we
- 13 need to do first but we need to be doing it because we can't
- 14 leave that. We can't wait for that.
- 15 What we have in front of us right now is perhaps
- 16 the states -- not in these terms, but the states actually
- 17 recognize something sooner than many of us in the markets
- 18 did which is the markets aren't giving us what we want.
- 19 We want cleaner energy. We want other kinds of
- 20 energy. We want other kinds of resources and when that
- 21 wasn't happening through the markets the states took actions
- 22 through tools that they have at their disposal through
- 23 legislation or regulation and said, "No, let's get what we
- 24 want."
- 25 And that creates the tension and the challenges

- 1 which we have in front of us now. I think what we -- in
- 2 order to really plot a good path through the accommodate
- 3 stage and the achieve stage I think we need to get in mind
- 4 how this is going to work when you have got wind and solar
- 5 and storage and controllable demand as your primary means of
- 6 energy production and delivery.
- 7 So stepping back from that where we are today in
- 8 terms of the role of markets -- we believe that the markets
- 9 are fundamental and can be adapted, can be modified to get
- 10 the states what they want, to get consumers and the nation
- 11 what we all need in terms of reliable and affordable energy
- 12 and address and get ahead of the climate and other
- 13 environmental goals that we all have.
- 14 So as NRG we are fully committed to moving down
- 15 the market oriented path and we think it can be done. In
- 16 the near term, the states have begun to act and Chairman
- 17 O'Connor and others referenced the substantial moves in New
- 18 England that are underway. Those are going to happen as far
- 19 as I know. I can't see any way to stop them from happening.
- 20 So we need to accommodate them in the markets,
- 21 recognize the double payment problem, the double purchase
- 22 problem, figure out a way to allow those resources to
- 23 actually have their role in the markets while not
- 24 undermining the markets for those of us who have invested
- 25 strictly on the basis of market revenues.

- So we have our two-tier pricing mechanism. ISO
- 2 has proposed its substitution auction, both good ideas that
- 3 merit further consideration. I don't think we are at the
- 4 tipping point yet but if we don't move fairly quickly on
- 5 this accommodate side and move a little farther into how do
- 6 we build some of those objectives into markets and further
- 7 how do we ensure that markets can actually support the kind
- 8 of renewable based future.
- 9 If we don't do all of those things then we could
- 10 very well tip over and I think that would put us in perhaps
- 11 I think that was option 4 from Chair LaFleur which I agree
- 12 would be about the worst of all possible worlds. I think we
- 13 need to commit to markets and move down this AAA path that
- 14 we have laid out or something along those lines.
- 15 MR. FORSHAW: Good morning and thank you for the
- 16 opportunity to be here. I'm here today speaking on behalf
- 17 of the group of municipal electrical utilities from
- 18 Connecticut, Vermont and New Hampshire. I also have a
- 19 feeling I'm probably going to be a little bit of an outlier
- 20 in some of my comments.
- 21 First of all starting with resource adequacy -- I
- 22 think it's important to note that really we no longer have a
- 23 uniform or a single resource adequacy standard in New
- 24 England now. We have a variable resource adequacy standard
- 25 that says will procure a certain quantity of resources at a

- 1 given price and those can vary over time.
- 2 Many folks believe that actually when we talk
- 3 about a capacity market we are really you know talking more
- 4 about an option based administrative pricing construct that
- 5 determines how much we pay for resources to come on to the
- 6 New England system, how much do we pay for resources that
- 7 you know we want to keep operating within the New England
- 8 system.
- 9 It's not really a free you know open entry, open
- 10 exit type structure. We spend many, many, many meetings and
- 11 as a consultant I like that but coming up with a bunch of
- 12 administrative assumptions on you know what's the cost of
- 13 resources, what are the projected non-capacity market
- 14 revenues going to be.
- 15 What are the forecasted economic conditions going
- 16 to be? How are suppliers going to behave? What are the
- 17 projected loads? How are resources going to perform? You
- 18 know, what kind of exposure will the region have to
- 19 reliability events and we construct demand curves and
- 20 evaluate supply offers based on you know, all of those sets
- 21 of assumptions.
- 22 I think the concern that we have is we are in a
- 23 mode right now and many have mentioned it where we have
- 24 these non-electric market policy requirements that have been
- 25 set out by the states, some of them are environmental, some

- 1 of them quite frankly are economic development.
- 2 Some of them are in response to you know, extreme
- 3 weather events we have had in the past and people looking
- 4 for added resiliency to the system on a local level. All of
- 5 those are out there. We have a construct where states have
- 6 obligations to pursue those. Customers want to pursue
- 7 those.
- 8 In terms of the ISO resource adequacy -- they are
- 9 independently going to looking at meeting those requirements
- 10 you know through the resource adequacy construct. That will
- 11 put us in a position today where we are going to have sort
- 12 of two buckets of resources.
- 13 A whole set of resources that are procured for
- 14 these non-market objectives and at the same time we are
- 15 going to have a bunch of resources procured to meet all of
- 16 the ISO wholesale market resource adequacy objectives and
- 17 that's where you get the redundancy.
- 18 I think in the last panel towards the end,
- 19 probably the most salient discussion was how do we integrate
- 20 those, allow states who might enter into bilateral contracts
- 21 with people to say okay I'm willing to develop a project and
- 22 we are on behalf of customers or customers directly are
- 23 willing to pay for that, irrespective of what the market
- 24 revenues might be.
- 25 And let those come in so that we don't have too

- 1 much capacity in the region. I think the key point is there
- 2 needs to be a critical mass and we all need to recognize
- 3 that in terms of whatever residual needs are met through the
- 4 wholesale market construct if you will and that's really the
- 5 point I think we all need to focus on to come around and
- 6 come together on, thanks.
- 7 MR. PATTON: Great question. I think the
- 8 question was through the roles who maintain resource
- 9 adequacy it is unambiguously FERC's role and the market's
- 10 role in facilitating and states have a role. I think this
- 11 is really a key question to delve into.
- 12 The states have a role. What makes these markets
- 13 unique is -- and we throw the word administrative around all
- 14 the time which frankly bothers me because what makes these
- 15 markets unique is the consumers don't participate directly
- 16 in the market. So somebody has to figure out what they are
- 17 demanding.
- 18 And one thing that they are demanding is
- 19 reliability so we procure a lot of things to provide the
- 20 kind of reliability that consumers are demanding so we
- 21 procure operating reserves beyond energy. Operating
- 22 reserves, we procure capacity -- so it's somebody's job to
- 23 figure out what consumers want and I think the states have a
- 24 role in defining what that is.
- 25 I would love at some point for somebody to take a

- 1 step back and look at this one day in 10 year standard but
- 2 there are lots of other requirements. And I think to the
- 3 extent that the states have a role in establishing the
- 4 planning standards, that's a key role and I don't want to
- 5 discount that, but then when you ask yourself then once the
- 6 requirements are determined whose job is it to satisfy those
- 7 requirements? It is the market's job to meet those
- 8 requirements.
- 9 And I would challenge you or caution you not to
- 10 think about this too simplistically because you know lots of
- 11 times we think about well a state wants to bring in 1,000
- 12 megawatts of whatever -- hydro in New England for example so
- 13 that may displace some resources.
- 14 And it's easy to think about that in a pool wide
- 15 context but there is far more going on in these markets than
- 16 simply what is the aggregate amount of megawatts that we
- 17 have to procure. There are transmission security needs in
- 18 local areas, there are second contingency requirements in
- 19 local areas that require us to buy capacity in those areas.
- 20 Some of that capacity has to be controllable at a certain
- 21 level. If they are not gas turbines we are really in
- 22 trouble in some of these areas.
- 23 We can't just you know stick a wind turbine in
- 24 there and imagine that is going to provide the same service.
- 25 So the nice thing is that the markets give us a mechanism to

- 1 price all of those requirements so we have local
- 2 requirements in a lot of these markets that serve a very
- 3 important role.
- 4 A lot of times people will think well the market
- 5 can operate as a residual but there is no such thing as a
- 6 residual market. The market is the market. You can sort of
- 7 pretend it's a residual but it is setting the marginal price
- 8 for every megawatt that's bought and sold which is why the
- 9 MOPR is so devastating for the resources that it is applied
- 10 to.
- 11 So if you think of it in that context and you say
- 12 well you know we have de-regulated the wholesale markets how
- 13 can we -- what is our whole theory on why the prices that
- 14 consumers are going to pay are just and reasonable -- it's
- 15 all premised on the markets functioning.
- The worst possible outcome you can imagine for a
- 17 capacity market is we need new resources, we set a price
- 18 that looks like it would recover more than the cost of new
- 19 entry for new units and investors don't respond so the price
- 20 keeps going up and we are watching billions of dollars flow
- 21 out the door.
- 22 It would be hard to imagine who could look at
- 23 that scenario and think that what we are seeing is just and
- 24 reasonable. Well what stops that? It's the willingness of
- 25 investors to put money into these markets to either build

- 1 assets. I like that we are focusing so much on retirement
- 2 because a lot of times it takes a lot of money to keep an
- 3 old 40-50 year old unit in the market.
- 4 And their willingness to put money in the market
- 5 is directly dependent on how credible the market is because
- 6 none of these investments pay off in one year. They are all
- 7 paying off over many years. So if they see things down the
- 8 road that could you know undermine the market and the
- 9 revenue streams that they may expect from the market, then
- 10 their willingness to invest is going to be fundamentally
- 11 undermined and that hurts everybody.
- 12 That hurts the states, that hurts consumers, that
- 13 hurts the investors so this isn't an us versus them we have
- 14 got to find a way to keep these markets working because we
- 15 have no backstop. We can't -- I don't know what it means --
- 16 I know what it means in the Midwest to say well let the
- 17 states just take it over because they are still vertically
- 18 integrated.
- 19 I don't know what it means in the Northeast if we
- 20 don't have a market that's functional. So I think at the
- 21 end of the day we have to -- but I also recognize the
- 22 importance or the truth that legislatures pass laws and
- 23 there's no choice but to implement the laws that they have
- 24 passed.
- 25 So I think at the end of the day we have to

- 1 really put our eye on what it is that would undermine the
- 2 market, you know where the rubber meets the road. And I
- 3 tried to articulate that in the comments and I worked with
- 4 ISO New England on their proposal to really focus on the
- 5 core of the issue which is artificial surplus.
- 6 If you can avoid artificial surplus then there's
- 7 an awful lot that you can allow the states to do that would
- 8 not fundamentally undermine the market. But I don't think
- 9 -- back to your question, I don't think anyone can move away
- 10 from the answer to this question with any other answer but
- 11 that it's FERC's responsibility to ensure that these markets
- 12 work to maintain resource adequacy and frankly the other
- 13 planning requirements that I mentioned.
- 14 MR. WHITE: Good morning Commissioners and
- 15 Commission staff. It's an honor to be here no pun intended.
- 16 Dr. Quinn you asked originally about responsibility and
- 17 accountability for resource adequacy.
- 18 The ISO believes that ensuring resource adequacy
- 19 requires a single entity to be accountable to those
- 20 standards. Those are complicated standards and you fulfill
- 21 them by having someone whose feet you can hold to the fire
- 22 to know they are fulfilled.
- 23 In New England's restructured electric system
- 24 going back 20 years that responsibility was vested with the
- 25 ISO and of course indirectly as David noted with our

- 1 regulators with FERC.
- 2 Other alternatives are possible. It is certainly
- 3 possible as Chairman LaFleur has noted -- I believe it was
- 4 the third door that states could if they choose to do so
- 5 take on that mantel and might call it -- since we live with
- 6 it, an albatross rather than just a mantel, particularly
- 7 through their actions they could take with the state
- 8 regulated utilities.
- 9 But echoing the comments that you heard on the
- 10 prior panel this morning the states have not indicated to us
- 11 any interest in taking on that accountability in New England
- 12 at least to day.
- To be clear the states have tremendous influence
- 14 over what gets built in New England through their siting
- 15 authority, through their environmental permitting authority,
- 16 through their obligations to carry out their legislative
- 17 mandates. We don't see that changing that's been true for
- 18 many, many years.
- 19 But ultimately we do not see -- we see that
- 20 really as something that we have to accommodate because we
- 21 do not foresee the ISO as facing a diminished role and
- 22 remaining ultimately the entity that is accountable to those
- 23 standards for resource adequacy.
- 24 MR. QUINN: So the last two David and Matt I
- 25 heard very unequivocally say that it is the market's role

- 1 and ISO New England's and FERC's role to do resource
- 2 adequacy ultimately. I liked the use of the word
- 3 accountability ultimately ISO New England and FERC are
- 4 accountable for resource adequacy in New England. Is there
- 5 anyone on the panel who disagrees with that fairly stark
- 6 statement? I should ask it the other way so I could
- 7 actually get comments.
- 8 So if no one disagrees that there is -- that
- 9 ultimately it is -- Brian?
- 10 MR. FORSHAW: Just yes I agree that the ISO plays
- 11 a central role. I guess I would argue that sort of defines
- 12 the minimum level of resources that might be needed going
- 13 forward to meet the reliability objectives.
- 14 And Matt I like your characterization that at the
- 15 end of the day the ISO you know really is going to stand to
- 16 being the accountable entity so thanks.
- 17 MR. MURRAY: I'll simply add that the way I heard
- 18 both statements with the caveat that you stole a response
- 19 both for implementing the regulatory powers of the state
- 20 legislature -- I worked at the Governor's Office when my
- 21 home state of Virginia had legislation to join RTO and I
- 22 could assure you had anybody represented to any Governor of
- 23 Virginia who has ever occupied that office that you are
- 24 surrendering state sovereignty when you join the RTO and you
- 25 are giving up your ability to act in any number of areas

- 1 whether it is climate, whether it is renewables, whether it
- 2 is general environmental policy siting I would have a hard
- 3 time seeing any Governor of Virginia I have known in our
- 4 modern history signing such legislation.
- 5 So it's always with the understanding that states
- 6 remain the one sort of unit of government in our federal
- 7 system that have plenty of regulatory powers and you don't
- 8 ask where's the state legislature in numerated power you
- 9 asks what stops the state legislature from doing it because
- 10 it is assumed that general regulatory powers, that's the
- 11 important caveat I would add.
- 12 MR. FULLER: Thanks Arnie. To take the bait on
- 13 that one I think the -- I absolutely agree that you know
- 14 it's the ISO's, it's the RTO's, it's FERC that are
- 15 responsible for and accountable for the resource adequacy
- 16 and reliability generally.
- 17 And I think that we keep hearing that loud and
- 18 clear from the states and I think it is evident in the
- 19 design. The challenge we have just to continue to pile on,
- 20 the challenges notwithstanding that you know as Bill
- 21 discussed you know the states have certain authorities, have
- 22 certain interests and those are beginning to increasingly
- 23 impede or step into effect that reliability issue.
- 24 So when you know, when states are doing things
- 25 for other purposes I want clean energy -- okay that's fine

- 1 you can get clean energy but that has effects on price, it
- 2 has effects on reliability. How do we wall that off? How
- 3 do we accommodate, how do we make that work?
- 4 So absolutely agree that the responsibility is
- 5 here but the bigger challenge now is to say in the face of
- 6 actions that are going on beyond that can we build the
- 7 markets that actually stop the states from feeling that
- 8 their needs aren't being served?
- 9 And in the meantime how can we accommodate that
- 10 so that the markets remain vibrant and sustainable?
- 11 MR. KAPLAN: And to continue on in the direction
- 12 that we are going you know the ISO and any you know
- 13 federally designated agency that is implementing this
- 14 responsibility of course needs to be aware of you know the
- 15 realities around it.
- I analogized in my written comments to Order 1000
- 17 that understanding the implications of state policy,
- 18 ignoring state policy in the design of markets in the
- 19 administration of the transmission planning process is a
- 20 ticket to higher costs.
- 21 You know you pay now or you pay later. You know
- 22 to indulge further in clich you know failing to plan is
- 23 planning to fail and it's planning to fail at higher cost.
- 24 If the way in which that very accurately described
- 25 responsibility that we all agree as Matt said, if we ignore

- 1 these realities in discharging that responsibility by the
- 2 ISO of maintaining adequacy -- if we ignore the realities of
- 3 the state policies then we will increase cost.
- 4 And it is incumbent upon the ISO in discharging
- 5 that responsibility to pay mind to those policies both in
- 6 terms of market design and in the way that it does
- 7 transmission planning and cost allocation.
- 8 MR. QUINN: Aleksander?
- 9 MR. MITRESKI: Alex Mitreski, Brookfield
- 10 Renewables. Just to kind of add on what Seth was discussing
- 11 earlier and I think it was a theme throughout all of the
- 12 comments that I read is that the ISO's do an excellent job
- in meeting two objectives which is least cost economic
- 14 dispatch and meeting reliability.
- 15 And I think when listening to the panel with the
- 16 state representatives it was -- I have been picking up two
- 17 themes. One is frustration and trust. So frustration that
- 18 the market is not delivering the needs of the states and it
- 19 was said that the ISO's need to design the markets with that
- 20 in mind I think that the ISO's do not have the mandate right
- 21 now and that's why they are only focusing on those two
- 22 objectives, which is least cost and reliability.
- 23 So we saw there in New England SK 11 there was a
- 24 need the basis was cleared there was a need, it was cleared
- 25 on this cost basis to maintain reliability. So I think this

- 1 is why we are here is that that third need, third constraint
- 2 in the ISO's model is not there.
- 3 And how do we get there? The ISO's do factor in
- 4 some of these state's policies so that they optimize the
- 5 solution to that. I think the ISO's have the ability, have
- 6 the tools, have certainly the expertise to design the market
- 7 but I think it takes a little bit of a trust and partnership
- 8 with the states to have an input in what and how that design
- 9 is implemented so that public policies are met through the
- 10 markets.
- 11 MR. QUINN: Tom?
- 12 MR. KASLOW: Thanks I only wanted to really
- 13 comment on one thing from an equal perspective. We are
- 14 certainly interested in the information the Commission has
- 15 as guidance on these issues but at this point I am not sure
- 16 we are asking for a mandate on the ISO. ISO New England has
- 17 been engaged in the NEPOOL IMAPP process as have regional
- 18 stakeholders and the states and discussions are still
- 19 ongoing.
- 20 MR. QUINN: And maybe that's where I will
- 21 follow-up. In the comments the pre-Conference statements
- 22 they are expected within New England there was a certain
- 23 theme of rounds -- accommodate versus achieve type solutions
- 24 and to some extent some of the comments suggested that it
- 25 was really a two- step process.

- The first step would be to accommodate. The
- 2 second step would be to achieve and I think I have heard a
- 3 little bit of that in the comments on the first set of
- 4 questions. I wonder if the questions are -- it feels like
- 5 Jeopardy where you are going to answer before I ask.
- 6 Is the sense that you could stop at accommodate
- 7 or is there a sense -- do you think that you have to start
- 8 with accommodate but then get to achieve? Get that mandate
- 9 to incorporate -- if it's the latter what happens in
- 10 between? Is it just that we magically discover the achieve
- 11 ability?
- 12 And how urgent is all of this? Is it urgent to
- 13 get from accommodate to achieve or again is accommodate a
- 14 fine landing spot so I didn't pay attention to who went
- 15 first.
- 16 MR. KASLOW: Thanks I'm going to speak generally
- 17 so maybe it's best that I go first. First of all when
- 18 NEPOOL set up the IMAPP process it didn't have a specific
- 19 solution in mind. In fact that was its purpose was to try
- 20 to increase education of the regional stakeholders and
- 21 explore ideas on how to address the challenges.
- 22 We have 17 different proposals and in the course
- 23 of discussions there are many issues, there's a lot of
- 24 complexities and I think things naturally broke down in the
- 25 proposals between accommodate and achieve.

- 1 And at least from a NEPOOL perspective at this
- 2 point there is no desire to say one versus the other or that
- 3 one was necessarily pursued before the other. I think as a
- 4 practical matter the proposals were made and as you will
- 5 hear from ISO New England there's a specific accommodate
- 6 proposal that they are going to be bringing through the
- 7 Committee process.
- 8 Our participant's agreement sets forth our
- 9 stakeholder rules. It does give ISO New England the ability
- 10 to bring a proposal to the process as it gives all other
- 11 stakeholders an opportunity to bring a competing proposal.
- 12 But there is a target in mind that ISO New England has of
- 13 having something in place for a February, 2018 forward
- 14 capacity auction.
- 15 So we are going to be taking -- we are going to
- 16 be considering the accommodate approach. At least ISO New
- 17 England and perhaps others for the longer term but we are
- 18 still determining the pace and direction of the longer term
- 19 solution. So I would emphasize again at this point we are
- 20 hoping that there isn't a specific mandate but we are
- 21 interested in guidance.
- MR. QUINN: Brian?
- 23 MR. FORSHAW: First of all I think we are clearly
- 24 in the accommodate camp. I think when we started thinking
- 25 about and looking at how do we achieve a lot of the other

- 1 objectives that are out there. You know, our capacity
- 2 market construct is incredibly complex.
- 4 to understand. When you see in option results where you
- 5 know June 1st of 2017 capacity costs are going to triple.
- 6 The following year they are going to go up to four times
- 7 what they are today. Then they are going to drop back down
- 8 and only triple.
- 9 And then a year after that it's 2.4 times what
- 10 they are. So you know that's again looking at it from the
- 11 perspective of the people on the ground, people at the end
- 12 of the pipeline who are going to have to pay the bills
- 13 there's difficulty understanding it.
- 14 When we look at achievement the question becomes
- 15 what are the objectives? What are you going to design --
- 16 whatever the market construct is going to be to achieve?
- 17 Each of the New England states and the regulatory
- 18 jurisdictions in the states have their own distinct set of
- 19 policy objectives, their own distinct set of policy
- 20 requirements. Each of those has potential implications on
- 21 wholesale market outcomes.
- 22 Some states put a greater emphasis on
- 23 environmental stewardship you know we heard it in the last
- 24 panel. Others look more to fuel security, fuel diversity or
- 25 a number of other things.

- 1 In addition there's a concern of one state having
- 2 to subsidize the different policy objectives of another
- 3 state. So when you put all of that together even having
- 4 smart people like David Patton and Matt White trying to
- 5 design something unless you can first get all the parties to
- 6 agree on what's the common set of objectives are going to
- 7 be.
- 8 And then secondly, consolidate all of those
- 9 competing objectives into a single objective function that
- 10 they can design around, that's going to be very difficult to
- 11 do. And so that's the concern about you know going too far
- 12 in terms of the longer term and really what brought us to
- 13 let's get down to the accommodate, let's try and avoid the
- 14 train wreck now and you know get some experience working
- 15 through that.
- Maybe something will come up where we can do
- 17 something better in the future. I mean you know we have had
- 18 our markets in place since you know the early 2000's and
- 19 maybe there have been 6 or 8 months where we haven't had a
- 20 major market re-design initiative during that time, thanks.
- MR. QUINN: Pete?
- 22 MR. FULLER: Thank you Pete Fuller with NRG. I
- 23 think the -- it's a good question, it's the right question
- 24 and I'd say that the accommodate piece is urgent and I
- 25 appreciate ISO's commitment to move for the FCA-13 time

- 1 period so I think that's on a good track.
- 2 I would say it's a necessary but not sufficient
- 3 step. If we go that far to accommodate whether it is
- 4 through a substitution auction or some other mechanism I
- 5 think we continue to have the situation that I think the
- 6 state legislatures and other policy makers have looked at
- 7 and -- yes but the market is not doing what I want so I need
- 8 to act.
- 9 What I hope we can do and I grant it is not a
- 10 trivial problem at all, it's a massive one but I think we
- 11 can make actually pretty good effort at it is to figure out
- 12 that objective folks that Brian referred to. Figure out
- 13 what the region needs even if it is not precisely the
- 14 prescription that any one state would lay out but that
- 15 actually addresses the clean energy and the reliability and
- 16 affordability goals and build something that moves us in
- 17 that direction.
- 18 And the hope would be that you know, the next
- 19 term of the legislature they can look at that and say well
- 20 you know what that's doing what we really want or its close
- 21 enough, it gets us where we are going. We don't need to act
- 22 separately. So I think the achieve part is it is a now
- 23 problem in terms of working on it, but I think it comes just
- 24 after the accommodate in terms of implementation.
- 25 I would say we need to get there if we are going

- 1 to get out of the cycle and to Chairman LaFleur's comments
- 2 and to Sue Tierney's comments not be back here talking about
- 3 it in 4 or 5 years. So I think we have to get to achieve.
- 4 MR. QUINN: So I think we'll do David, Matt and
- 5 then Bill, Seth and then we will go to the Commissioners of
- 6 FERC for questions.
- 7 MR. PATTON: Okay so I think it's hard to imagine
- 8 that achieve is a good idea going beyond accommodate. But I
- 9 think a lot of it centers around the objective and we can't
- 10 ignore what it is the objective is. So if the objective is
- 11 a technology neutral public policy objective like reducing
- 12 carbon emissions then that certainly is achievable through
- 13 markets.
- 14 We monitor the RGGI market in the Northeast and
- 15 it works great. There's no question in my mind that you
- 16 could use the RGGI to accomplish any carbon goal you could
- 17 articulate and then the wholesale electricity markets would
- 18 actually help you.
- There's also no question that it would be very
- 20 expensive in the short run but in the long run I think
- 21 subsidies end up being more expensive than allowing the
- 22 market to achieve an objective like that.
- 23 On the other hand if your objective is technology
- 24 specific or unit specific even that's just not something
- 25 that I can imagine achieving in the market. Having the RTO

- 1 run an auction that's designed to achieve something that
- 2 specific is not that dissimilar from a state running an RFP.
- 3 I'm not sure what the advantage of doing it is
- 4 other than it gives you a mechanism to spread the costs to
- 5 more people which seem like a disadvantage in my mind. So I
- 6 think accommodate is the essential piece because it allows
- 7 you to navigate the point where the markets are going to
- 8 struggle and to try to protect the market in light of what
- 9 the states want to achieve.
- 10 But I don't know how you go any further beyond
- 11 that. The proposal that we have worked on with New England
- 12 I think actually is a sound long-term proposal.
- MR. QUINN: Matt?
- 14 MR. WHITE: First I want to thank David for his
- 15 last comment which was not agreed upon in advance so I
- 16 certainly owe you a beer for it. I actually would second a
- 17 number of the comments raised by both Brian Forshaw and
- 18 David just now.
- 19 We agree that accommodating the current
- 20 activities of the state is a pressing issue for New England.
- 21 I think that has been an increasingly prevalent view that I
- 22 take away from our broader integrating markets and public
- 23 policy process that Tom and NEPOOL have shepherded.
- 24 We have developed a fairly detailed proposal that
- 25 we believe is worth betting and working through with

- 1 stakeholders of the coming year and can help lead to a
- 2 productive solution at a problem in concern with the ideas
- 3 that stakeholders are brought forward.
- 4 And that is really timely and essential because
- 5 of the procurement timing highlighted by Commissioner
- 6 O'Connor's comments in the prior panel. That said you asked
- 7 in your question and as I wrote down, get a mandate to
- 8 achieve and so forth and I kind of stopped at the word
- 9 mandate because being on the business end of 9 complex
- 10 NOPR's and orders under the prior Chairman the word mandate
- 11 just makes me shudder at this point.
- 12 It is a challenge to make progress and keep up
- 13 with the volume of issues that are pressing price formation
- 14 issues as it stands today. That said, I think to your
- 15 question about the achieve objectives -- I think there are
- 16 differences of opinion among regional stakeholders.
- 17 I think it raises -- where that will go is
- 18 unclear and it certainly would warrant greater vetting
- 19 before anyone draws firm conclusions about the regional
- 20 position on that. At a root cause I think part of it is
- 21 that it raises significant issues that go beyond the issues
- 22 posed by just the accommodate solution.
- One of them was hinted at by Alex Mitreski
- 24 earlier in this panel where he commented on the scope of the
- 25 ISO's authority. We were created essentially -- I counted

- 1 one thing which is keep the lights on cost effectively you
- 2 can call that two if you like.
- 3 But what's notably not in there is and meets
- 4 certain environmental objectives. And if we were going to
- 5 be asked to do that in the future there is an immediate
- 6 question about maybe that's not a little step. That is
- 7 changing in fact the scope of what the ISO's are asked to
- 8 do.
- 9 There is nothing about that in our corporate
- 10 mission statement and arguably this of course tees up the
- 11 broader jurisdictional questions of the Commission's scope
- 12 of authority. Then there is the question of what are we
- 13 actually seeking to achieve?
- 14 As David and many others have highlighted and I
- 15 believe that perhaps it was Jeff Bentz earlier in this
- 16 morning's panel that said that economists require specific
- 17 objectives before they can go design a good market for
- 18 anything. I couldn't agree more.
- 19 There are no truly specific objectives on the
- 20 table for that. That process has not gone far enough and
- 21 perhaps more importantly not all states may necessarily
- 22 agree on the specific objectives they might want to achieve
- 23 and so that must be reconciled taking us back to the
- 24 challenging issues you posed this morning about how does one
- 25 reconcile differences than what the states want the ISO to

- 1 do -- there's only one ISO.
- 2 And last but not least we actually have written a
- 3 fair bit on many of the issues stakeholders have brought up.
- 4 I would highlight for people interested in a January 25th
- 5 paper that my colleagues and I developed.
- To give you the bottom line so you don't have to
- 7 read about 25 pages of it many of the ideas under achieve
- 8 with the possible exception of something -- I know it was
- 9 just an expansion of RGGI and has been restricted from the
- 10 state's domain are likely to be extremely complex, very
- 11 resource intensive at a very high level.
- 12 They involve new products or new options and
- 13 anything that involves creating new products and new options
- 14 involves not only new market rules and stakeholder process,
- 15 but software systems, financial assurance, accountability,
- 16 performance standards. And once you are in this you are in
- 17 a long multi-year process that could be very resource
- 18 intensive so it is not something for which the path at this
- 19 point is entirely clear.
- 20 MR. QUINN: Thank you. My feelings are hurt by
- 21 the way about the price formation comment.
- 22 MR. MURRAY: I'll just close by saying my own
- 23 view and I think well I'm certain that many of you, we don't
- 24 view it as a market failure when a state acts. The state
- 25 acts because they are a sovereign entity with broad

- 1 regulatory power and what makes sense for a state is
- 2 something that the elected official of that state are often
- 3 in the best position to judge.
- I will observe that we have been here for a
- 5 couple of hours now and no one said the word Congress
- 6 because we are in a policy and political era where we really
- 7 don't expect a lot of policy making at the national
- 8 legislative level.
- 9 So in the absence of federal legislative action
- 10 and it's neither a bad nor a good thing, it's simply an
- 11 observation. Of course you are going to see the states
- 12 being more active, that shouldn't be surprising at all.
- 13 In the discussion this morning we have had
- 14 reference to RGGI which is 9 states and the difficulty of
- 15 getting consensus among 9 states. We have heard New England
- 16 is the unit of analysis, we have heard southern New England
- 17 is the unit of analysis. At the end of the day we are the
- 18 locusts of what policy making is and we are going to see the
- 19 most frequent policy makers at the state level.
- 20 It's the whole U.S. federal system has always
- 21 been designed -- it's not a judgment of regulators, it's not
- 22 a market failure it is simply the prerogative of the state
- 23 legislature it's nothing more than that.
- MR. QUINN: Thanks Seth?
- 25 MR. KAPLAN: Yeah and to put a little bit of a

- 1 sort of a legal and Constitutional gloss on sort of the
- 2 message that achieve is much harder. You know I think that
- 3 just a basic principle of comedy and cooperative federalism
- 4 is that the federal exertion of authority over the states is
- 5 minimized you know, if only just in order to kind of keep
- 6 the wheels turning.
- 7 You know the fed's act when needed and just
- 8 simply the achieve kind of goals where the FERC and the
- 9 delegated authority through the ISO imposes a system that is
- 10 intended to achieve state goals as opposed to accommodate by
- 11 its nature will require more exertion of federal authority,
- 12 more friction.
- 13 And the good principles of cooperative federalism
- 14 is to try the thing that is lower friction first before the
- 15 thing that induces more friction. One thing that is just in
- 16 terms of the reality of what's going on here -- as Chairman
- 17 O'Connor noted Massachusetts is on the eve of doing another
- 18 procurement for I would note both Tier 1 renewables and
- 19 hydro is what the legislation calls for, both are eligible.
- 20 And those -- you know that procurement is
- 21 laudable and it is wonderful that it is moving forward and
- 22 that reflects a longer term goal. A desire by Massachusetts
- 23 as the states have to enter into get their customers the
- 24 benefit of those longer term obligations of power that is
- 25 not -- the price is not sensitive to fuel prices.

- Just looking at where we have vacuums we do not
- 2 have a federal mechanism that gets customers that value,
- 3 that commodity. Now in the long-term could such a mechanism
- 4 be created? Certainly -- you know there is nothing that
- 5 says that all federally regulated markets need to be real
- 6 time or day ahead or one year or three years or five years
- 7 of fifteen years.
- 8 One could imagine the mechanism where a federal
- 9 market got customers the value of that longer term resource
- 10 but that will be a heavier lift to circle back where I
- 11 started -- and I think that's sort of an overall theme here.
- 12 Let's do what we can that induces less friction
- 13 that is accommodate before we start really going down that
- 14 path of trying to fill in that -- to meet that need that the
- 15 states have identified for customers to get their value
- 16 through a federal mechanism.
- 17 MR. QUINN: Thank you, Commissioners?
- 18 CHAIRMAN LA FLEUR: Well since most of you have
- 19 expressed a fair amount of optimism of coming up with some
- 20 sort of regional solution I hate to pile another kind of
- 21 fuel on the fire but I feel like it's my last chance to see
- 22 you and it's not ex parte so what's going around my head is
- 23 like what works for new resources and who picks new
- 24 resources and what works for existing resources and what's
- 25 going on.

- 1 And most of the policies we have seen so far pass
- 2 legislatively in New England are procurement policies, some
- 3 of them very specific and the ISO New England, CASPAR
- 4 proposal is geared to that. Let new things come in and how
- 5 you wean other things off.
- 6 The conversation in the other RTO's that were
- 7 about to start is a lot of it about out of market payments
- 8 for existing policies which is something I understand the
- 9 Connecticut legislature is actively talking about.
- 10 Mr. Murray said in his pre-filed comments he
- 11 doesn't think paying what Connecticut is talking about is an
- 12 out of market solution and it would not affect the market.
- 13 If what happens in the other two regions in New York and
- 14 Illinois happens here what will happen is that if that get
- 15 passed within a couple of days we will get a complaint at
- 16 FERC and it doesn't seem like what you are talking about is
- 17 about shoring up existing resources.
- 18 Yet the more new resources get piled on the more
- 19 they might need that. So I would like to ask anyone else
- 20 while we have this opportunity to comment on support for
- 21 Nuclear New England, where you see that fitting in to this
- 22 picture.
- 23 Because it does seem that we see a lot of
- 24 different kinds of state policies and not all of them fit
- 25 into the procurement plan that ISO New England talked about.

- 1 So if anyone has anything to add I would appreciate it.
- 2 MR. FORSHAW: I'll try and kick it off. Thank
- 3 you Madam Chair. I think the structure that we have tried
- 4 to articulate in my statement that we put forward in the
- 5 IMAPP process was a bilateral residual type of construct.
- 6 Really what we are focusing on there is simply if
- 7 a load customer or states on behalf of customers in general
- 8 come up with a contract and that's enough to support the
- 9 resource without getting any capacity market payments that
- 10 comes in there. The challenge in that structure which you
- 11 mentioned with the earlier panel is making sure there's a
- 12 critical mass in the residual market so that pricing is
- 13 sufficient to allow existing resources to remain, continue
- 14 operating any other resources that aren't procured subject
- 15 to a bilateral contract.
- 16 You know the prices are high enough that those
- 17 can come in. That's not a trivial challenge either but at a
- 18 high level you know we see that as that first step -- the
- 19 bilateral market. It doesn't necessarily have to
- 20 differentiate between new resources, existing resources or
- 21 anything else.
- 22 CHAIRMAN LA FLEUR: I appreciate the clarity of
- 23 your pre-filing comments. I mean I do understand that when
- 24 the New England states de-regulated, they didn't de-regulate
- 25 the muni's and that has been an issue. I understand that.

- 1 But it sounded like your comment said turn New
- 2 England into ISO and I didn't hear the states raising their
- 3 hand to do that. You know I mean there are regions that run
- 4 with state authority for resource adequacy and the capacity
- 5 market is residual but that is a different construct.
- 6 That's just I mean I know where you are coming from, okay
- 7 thank you I'll shut up and let other people talk.
- 8 MR. QUINN: Alright. I have Bill, Aleksandar,
- 9 Pete and then David.
- 10 MR. MURRAY: Without repeating what's in the
- 11 pre-filed testimony one comment I will make since the
- 12 Chair's question was posed about New York, Illinois,
- 13 Connecticut I must apologize I don't work in New York or
- 14 Illinois so I am going to speak just in a very global level.
- 15 Globally what the three states have in common is
- 16 they are attempting to recognize around the clock carbon
- 17 free resource in a way -- in various forms in a way that is
- 18 analogous to what they have long done in renewable portfolio
- 19 standards since the early stages of the market.
- 20 Recognize with nuclear you have got fewer units
- 21 with a lot more megawatt hours. You also have the ability
- 22 to run around the clock. You have got a market for energy
- 23 and what the states are doing is recognizing the carbon
- 24 attributes at a time when states -- those three states all
- 25 share a philosophy towards moving towards a lower carbon

- 1 public policy, a lower carbon economy.
- 2 And that in our view is entirely complimentary to
- 3 the activities of the market. I will say more broadly
- 4 working back to what I had just said about sort of the
- 5 absence of federal action the -- you know we were involved
- 6 in a nuclear unit closing in Wisconsin.
- 7 That was a well-running nuclear unit that closed
- 8 for purely economic reasons. I don't think that was a
- 9 public policy success and I would not necessarily just
- 10 speaking only from me point to that as a market success. I
- 11 think that that is something that you could even go so far
- 12 as to say it was a market failure.
- 13 There is probably broad recognition at the
- 14 federal level that this is a problem. There is not equally
- 15 broad federal action and the absence of federal action
- 16 states quite appropriately using the tools that they have
- 17 and exercising those tools albeit in three different forms.
- 18 I would share what is in common among the three
- 19 states is that they are recognizing the carbon attributes of
- 20 nuclear units.

21

- 22 CHAIRMAN LA FLEUR: Do you draw a
- 23 distinction from the state as recognizing carbon and some of
- 24 the discretion of resiliency and so forth which is fairly
- 25 heavy overlap with what the ISO is pricing?

- 1 MR. MURRAY: It states in choosing to recognize
- 2 carbon -- nuclear is unusual and that it is an around the
- 3 clock or base load resource I think as an industry we have
- 4 got to start using more common -- we have to let base loaded
- 5 dispatchable go and say on off switch and around the clock.
- 6 Nuclear has both of those attributes but I don't
- 7 think -- they are distinct attributes and there is not
- 8 another resource that has both of those attributes that is
- 9 in place now. Notably states are bringing in hydro which
- 10 has some of those same types of resources.
- 11 They have hydro and they are bringing in more
- 12 hydro.
- 13 MR. QUINN: Aleksandar?
- 14 MR. MITRESKI: Speaking of hydro -- I think it's
- 15 an excellent question Commissioner because it's the -- I've
- 16 heard the panel discuss about achieve and accomplish and
- 17 accommodate but if we don't come up with a comprehensive
- 18 solution what's happening in the CASPAR solution as you have
- 19 pointed out there is a lot geared toward new resources
- 20 coming in to meet state policies.
- 21 But those new resources will have some constricts
- 22 and some of them may be inadvertent and I think that the
- 23 state's policies do not intend to be counter-intuitive such
- 24 as they effect the existing non-emitting research. So what
- 25 I started initially the comment if you place one big connect

- 1 to another although they are providing the same product one
- 2 will certainly have the effect on another in terms of
- 3 revenue.
- 4 And speaking from a hydro resource and I think
- 5 there's companies from various technologies here in the room
- 6 but if I ask anybody that has a resource that is 100 years
- 7 old and still performing, producing energy I think we would
- 8 have very few people who could raise their hands.
- 9 So my point is these hydro resources go every 30
- 10 to 40 years through a FERC licensing renewal process,
- 11 continual investment of capital to be performing over this
- 12 long-term period. So having a comprehensive solution that
- 13 maybe as Jeff pointed out -- maybe it won't meet 100% of the
- 14 state policies, maybe come up with a solution that will meet
- 15 90% of those state policies -- maybe in this situation you
- 16 could make sure that the existing non-emitting resources
- 17 such as nuclear, such as hydro, such as wind was also coming
- 18 to a tail end with some of the PPA's.
- 19 It will continue to be compensated, continue to
- 20 meet some of these state policy goals and I think that's
- 21 where if we overlook that we will come up in a situation. I
- 22 just want to go through one more point where we had an FCA
- 23 tent in New England where 1,000 megawatts of new capacity
- 24 cleared because that's what the market was sending the
- 25 signal.

- 1 However, with the procurements now they may come
- 2 in as hydro. So you can say was the 1,000 megawatts
- 3 necessary -- I think that's why going back to the ISO having
- 4 that comprehensive view of those public policies that can
- 5 ensure the public policies are met.
- 6 MR. OUINN: Pete?
- 7 MR. FULLER: Thanks and Chairman LaFleur what I
- 8 heard in your question really was the distinction between
- 9 new resources, procurement of new and payments to existing.
- 10 And I think this is one of the conundrums that I am
- 11 struggling with and have struggled with through IMAPP and
- 12 other processes.
- 13 I believe the states and their representatives
- 14 are very sincere in their desire for markets and recognize
- 15 the tremendous value that has been delivered through
- 16 markets. But I think one of the principals that we have to
- 17 keep in mind in markets is for lack of a better term and I'm
- 18 not an economist -- equal pay for equal work.
- 19 And so we need to come up with ways to define
- 20 what it is we want in ways that are technology neutral, fuel
- 21 neutral and let the market find the lowest cost outcome.
- 22 And I would argue that whether it is New York or Illinois or
- 23 the Connecticut pending discussions and frankly a lot of
- 24 what Massachusetts is doing in its RFP's is not about that.
- 25 It is very specific. It is very directed. Some

- 1 cases the definitions are a little more tortured and
- 2 circuitous but they all kind of get you to the same place.
- 3 We know exactly what we want as the solution and I think
- 4 that to me is where the red flag should go up for the
- 5 Commission and say if you really do something that's
- 6 tech-neutral, fuel neutral we can work with it.
- 7 If you start tipping the scale that's really
- 8 going to be a problem -- so I think recognizing that equal
- 9 pay for equal work is an important principle to keep in
- 10 mind.
- 11 CHAIRMAN LA FLEUR: Well it seems a lot of this
- 12 is revolving around carbon because every state in New
- 13 England has a carbon goal. RGGI prices carbon but we heard
- 14 about that. We have a clear paper from NESCOE, whatever you
- 15 do don't price carbon.
- Now Connecticut wants to come along and price
- 17 carbon. We have got a little discontinuity about where we
- 18 are I think.
- 19 COMMISSIONER HONORABLE: And if I could jump in
- 20 here to say one question that I have is could we even agree
- 21 upon the subjective we heard from the economists. If we
- 22 need to improve our market design we need to start with some
- 23 metric -- what is the objective?
- 24 Can we even agree upon that if we are going to
- 25 first tackle accommodating say policy before we even get to

- 1 the topic of achieving which I thought I heard David Patton
- 2 saying let's start with accommodating then we can talk about
- 3 achieving.
- 4 So I want to jump in on that conversation and ask
- 5 you, can we even agree upon that first objective?
- 6 MR. FULLER: If I could Commissioner -- you know
- 7 we presented this idea in the IMAPP process a few months ago
- 8 and at the time did not represent it as the answer. But I
- 9 think it gives an interesting way to sort of get into this
- 10 discussion and to start to get your heads around it.
- 11 In New England all of the six states have RPS
- 12 goals -- so clean energy goals. And those are legislative
- 13 and they are on the books and so as a starting point to
- 14 begin to think about this could we look at the achieve
- 15 element in terms of clean energy market or clean attribute
- 16 market to say they have all got their trajectories out there
- 17 about how much clean energy they want, could that form the
- 18 basis of a purchase requirement that is centrally procured?
- 19 COMMISSIONER HONORABLE: Do you agree with, I
- 20 think our panelists on the earlier panel said, maybe it was
- 21 Bob Scott said starting maybe with the least common
- 22 denominator so I want to push you a little bit on that, what
- 23 do you think about that as a beginning point?
- 24 MR. FULLER: If you are thinking that is the
- 25 least common denominator, yeah that's why we put it forward

- 1 to make it a little more tangible that in fact there may
- 2 actually be some alignment even if it isn't everything in
- 3 the full requirements, there is at least the basis to begin
- 4 working on something to create a structure, create a
- 5 mechanism and again glass half full -- if people see that
- 6 that can be effective and can actually bring the kind of
- 7 investment that the Massachusetts legislation is trying to
- 8 do and others are thinking about.
- 9 Can we get some momentum going and build on that?
- 10 MR. QUINN: David do you want to take a shot at
- 11 both questions and then we will --
- 12 MR. PATTON: Sure. You know I'm not quite as
- 13 optimistic at bringing some form of consensus around the
- 14 objective. I think it's interesting because the objective
- 15 and the rationale are two different things. So the
- 16 rationale for the nuke action is zero carbon.
- 17 But as we have shown in our reports it's
- 18 generally cheaper to achieve carbon reduction by building
- 19 really efficient combined cycle units and retiring in
- 20 certain locations and retiring high emitting units which is
- 21 obviously not at all consistent with what the policies that
- 22 we are pursuing.
- 23 So I think we have in working in various regions,
- 24 we haven't seen a coalescence around you know a single set
- 25 of objectives and certainly when you get to renewables it's

- 1 hard to equate that with carbon because carbon price can't
- 2 be high enough to make a lot of the renewables economic.
- 3 To your question on the uneconomic retention -- I
- 4 saw you rubbing your head and it looked very familiar to me.
- 5 I find myself doing that a lot, thinking about these issues.
- 6 And what makes it a little easier is we always try to start
- 7 with the principle which is why I put that in our comments
- 8 about any solution you come up with should have a set of
- 9 principles.
- 10 And if the first principle is that the threat to
- 11 the market is related to artificial supply then you can sort
- 12 of put everything into that context and say okay how big of
- 13 a threat are renewables? How big of a threat is the hydro?
- 14 How big of a threat is the nuclear intervention?
- 15 Renewables actually ends up being a much smaller
- 16 threat than you would think and we put a table in our
- 17 comments showing how much -- how many megawatts we think are
- 18 going to be generated through various initiatives over time.
- 19 And the reason is that most of the renewables get very small
- 20 capacity value so their actual supply in the capacity market
- 21 is pretty small with the exception of the hydro and
- 22 off-shore wind is actually quite a bit bigger than on-shore
- 23 wind.
- 24 But the nuclear ends up being a bigger threat in
- 25 some regards and smaller in other. Bigger with respect to

- 1 the size of the units we are talking about. There's nothing
- 2 on the horizon on the renewable side that comes even close
- 3 to the size of some of these nuclear units.
- 4 On the other hand they are far closer to being
- 5 economic than some of the renewables. But in thinking about
- 6 it in that context I think you can look at solutions like
- 7 the CASPAR solution and it could actually be applied in an
- 8 uneconomic retention sort of context.
- 9 But then the last thing I would say is at the
- 10 beginning of our comments we talk about and I can't think of
- 11 another word other than legitimate and I think somebody
- 12 mentioned that distinction of legitimate policy and policy
- 13 that is targeted at objectives the RTO's have handled.
- 14 When you start looking at uneconomic retention
- 15 it's the nuclear -- I think there are some arguments about
- 16 it being carbon related but there are other uneconomic
- 17 retention that I think is much harder to put into context
- 18 and so if you are going to go down the road of figuring out
- 19 how to address the uneconomic retention it is still
- 20 important to make that distinction and not just accommodate
- 21 everything.
- 22 MR. QUINN: Thanks. So I think to Commissioner
- 23 Honorable's question I have got Bill, Seth, Tom and Brian.
- 24 MR. MURRAY: In this phrase you talk about the
- 25 three states and on Connecticut a little bit. We've been

- 1 talking about those unique attributes of each state and one
- 2 unique attribute of Connecticut is they have the highest
- 3 power prices paid by retail customers in the lower 48.
- 4 So there's an opportunity -- now it varies a
- 5 little month to month, the records the Commission keeps but
- 6 just like in other states we operate in generally
- 7 residential rates and Virginia would be very competitive
- 8 with industrial rates in Connecticut.
- 9 So there's an opportunity in looking at
- 10 Connecticut policy makers and looking at policy options
- 11 available to them. As I understand the conversation around
- 12 Senate Bill 106 which is I think the legislation that has
- 13 been referenced. There are discussions there is an
- 14 opportunity to recognize the carbon attributes of two very
- 15 large nuclear units that Connecticut has.
- 16 And one reason Connecticut is acting in this area
- 17 is Connecticut has got two big nuclear units which are a
- 18 little over half of the generation of the state. A state
- 19 without nuclear units may feel less pressed to act in that
- 20 regard.
- 21 So as I understand the policy conversation in
- 22 Connecticut and this is a bill that's passed Committee but
- 23 certainly has not passed the General Assembly yet. The
- 24 question is can we have our cake and eat it too. That's
- 25 been used a couple of times here.

- 1 Can we recognize carbon attributes as the Chair
- 2 acknowledged at the same time provide some long term price
- 3 certainty for customers recognizing as it was just said that
- 4 nuclear is as a resource more competitive with where gas is
- 5 right now and some other types of resources and recognizing
- 6 that any of us who feel we can predict natural gas markets
- 7 forever and ever again should probably be on that private
- 8 island that many of us have been talking about.
- 9 So is there a spot to have our cake in
- 10 Connecticut and eat it too in the sense of long-term price
- 11 certainty, potentially a savings to customer by cutting out
- 12 some of the intermediary parties that are typically involved
- 13 -- the middle man if you will, and at the same time achieve
- 14 carbon goals.
- 15 And as I understand the conversation on the
- 16 legislation -- that's the goal of the legislation.
- 17 CHAIRMAN LA FLEUR: I think it would be
- 18 interesting to have a conversation which we don't have time
- 19 for of how much of your cost increases are driven by the
- 20 wholesale energy market versus other things. And I think
- 21 this is another thing -- it's going to go through retail
- 22 rates I assume I mean it's a state decision I guess.
- 23 MR. MURRAY: Well I would simply observe that the
- 24 very significant downturn in wholesale power prices in New
- 25 England has not been fully reflected in retail bills paid by

- 1 customers in Connecticut.
- 2 MR. OUINN: Seth?
- 3 MR. KAPLAN: One very simple thought is that yet
- 4 another reason to focus on accommodate rather than achieve
- 5 is for this reason of identifying objectives. That you know
- 6 you need to refine the objective needed much more sharply if
- 7 you are actually shaping an achievement mechanism as opposed
- 8 to accommodate.
- 9 I would simply suggest in terms of the
- 10 conversation that's been going on here about the question of
- 11 an open process that is intended to inspire new generation
- 12 as opposed to subsidizing existing generation.
- 13 That one principle that one might look at is that
- 14 a state in attempting to achieve a legitimate goal like
- 15 greater price stability -- not dictating what the price is
- 16 but trying to achieve some stability and customer protection
- 17 against the rising and falling fuel prices.
- 18 That in achieving that legitimate perspective
- 19 that a state might be required to employ more of a market
- 20 mechanism and whether that is through a competitive RFP that
- 21 is truly open and competitive to all comers or more of an
- 22 option or something like that.
- 23 But as opposed to -- as people were saying as
- 24 more focused on a targeted existing resource. And you know
- 25 just simply saying and trying to walk that line and saying

- 1 okay the state has this legitimate desire to maintain
- 2 greater stability for the customers that live within its
- 3 borders, let's figure out a way to accommodate that in a
- 4 mechanism that you know that recognizes that they are doing
- 5 that in a method that is most respectful of maintaining
- 6 markets.
- 7 COMMISSIONER HONORABLE: I wanted to make two
- 8 points before I conclude. One is that I think our mere
- 9 presence here today should reflect that we absolutely want
- 10 to be accommodating but we all have mandates too.
- 11 So I think it was Mr. Murray that said the C work
- 12 Congress. We are getting ours from Congress and we can have
- 13 another subject -- conversation on another day about what
- 14 Congress says and the roles of state and federal government.
- 15 For our part we certainly want to accommodate
- 16 states but it is going to take cooperation on both of our
- 17 parts. It's not just the feds doing something to the states
- 18 or increasing rates on retail consumers. This is the hard
- 19 part and so I'm really -- well maybe Dr. Patton isn't as
- 20 hopeful as I am.
- 21 I'm hopeful that with all of the experts that we
- 22 have here we are going to find a glimmer of the start of
- 23 cooperation where we are both operating in reality that our
- 24 work is reflecting and impacting the other, so I appreciate
- 25 your comments today.

- 1 MR. QUINN: Tom?
- 2 MR. KASLOW: Thanks actually a good follow-up.
- 3 Certainly from the New England region there has been a lot
- 4 of cooperative dialogue with respect to your question about
- 5 what's the outlook on progress of achieving some type of
- 6 proposal to accommodate state resources.
- 7 We all work better under deadlines and ISO New
- 8 England is introducing its proposal into our process in
- 9 June. They are going to have a certain schedule on that. I
- 10 presume if they are looking for the February option some
- 11 time toward the end of this year and we have the right under
- 12 participant's agreement to offer competing proposals but
- 13 they ultimately can request a vote, hopefully with a
- 14 consensus.
- 15 And I'm sure that's what they are working toward.
- 16 But if not there can be competing proposals. There could
- 17 even be a jump ball filing which is unique to New England
- 18 but I think that you will have more feedback on that by the
- 19 end of this year thank you.
- 20 COMMISSIONER HONORABLE: Thank you.
- MR. QUINN: In response to that?
- 22 MR. WHITE: Yes I just wanted to confirm and
- 23 second Tom's characterization. He actually believes this is
- 24 a priority accommodating issues is a priority issue. There
- 25 are a number of concrete ideas on the table. We have added

- 1 ours and we think it is productive to engage with
- 2 stakeholders.
- 3 We have indicated that we do think it is prudent
- 4 for the region to work toward being able to develop this
- 5 sufficient to use it in our 13th option, that's the one in
- 6 2019 which would require us because of the timing of when
- 7 resources that may elect to retire are required to meet
- 8 certain deadlines.
- 9 Under the current tariff we would require a
- 10 Commission decision, hopefully a full Commission decision by
- 11 approximately March which would mean we would be aiming with
- 12 the region to work toward a filing no later than essentially
- 13 the first of the New Year.
- 14 It will be a push for the region but we look
- 15 forward for the opportunity to work with everyone.
- MR. QUINN: Unfortunately I think we probably
- 17 have to kind of wrap up, just to kind of keep us moving. So
- 18 with that I'll say thank you to the panel, apologize to
- 19 those that didn't have a chance to speak and then I look
- 20 forward to the New York state panel, thank you.
- 21 PANEL 3
- 22 MR. QUINN: So I appreciate the discussion so far
- 23 this morning with our second session focused on New York
- 24 ISO. We will start again with our state panel -- exactly
- 25 the same format and the same objective as we had for our

- 1 state panel with ISO New England.
- 2 So I will cut to the chase and introduce our
- 3 panelists and say thank you for joining us. We have Susanne
- 4 DesRoches, the Deputy Director of Policy, Infrastructure for
- 5 the City of New York.
- 6 We have Janet Joseph the Vice President for
- 7 Innovation and Strategy at NYSERDA and we have Scott Weiner
- 8 the Deputy of Markets and Innovation for the New York State
- 9 Department of Public Service.
- 10 Thank you for joining us. We look forward to
- 11 having you join us after lunch at the state table. So I
- 12 think the first couple of sessions this morning we have kind
- 13 of gravitated to this opening question about what role do
- 14 you see as representatives of either the city or the state
- 15 for the wholesale markets broadly but also very particularly
- 16 in providing resource adequacy?
- 17 I think we heard one message from New England but
- 18 the purpose really for the first day of doing regional
- 19 panels, regional sessions is because we think there's
- 20 actually a potential there that you would give us a
- 21 different answer.
- 22 So we would look to hear what your point of view
- 23 is and what role you hope for the wholesale markets and in
- 24 particular in achieving resource adequacy.
- 25 MR. WEINER: Thank you I'll start. Without

- 1 wanting to be facetious I would say it depends. And one of
- 2 the takeaways of course from all of the dialogue that has
- 3 proceeded it this morning and the Commission -- many of you
- 4 were in New York City about two years ago, two and a half
- 5 years ago when part of this discussion took place.
- 6 It takes place in many venues in many forms. And
- 7 what we heard this morning to me is that it depends. And I
- 8 want to really stress the point that how we collectively
- 9 decide something is a necessary pre-requisite and it can be
- 10 as important certainly and maybe more important than what we
- 11 decide.
- 12 And I would like to stress that if we are going
- 13 to tackle that question a couple of things. Number one we
- 14 are at an inflection point and one of the elephants -- the
- 15 herd of elephants that we have in this room is to really not
- 16 only recognize that we are at this inflection point we are
- 17 not in the same set of environmental influences that affect
- 18 or should influence market design that have existed in the
- 19 past.
- 20 And I think we need to embrace that and we need
- 21 to recognize that and set that as a foundation. I want to
- 22 endorse enthusiastically and wholeheartedly the point that
- 23 we have to come up with principles and unlike David Patton I
- 24 am very optimistic.
- 25 And I'm optimistic that we can find the

- 1 similarity not just because we have to but because if we are
- 2 going to start and say let's recognize the paradigm that
- 3 exists today -- not that existed back in the 1990's, not
- 4 that has evolved through a number of very well meaning, very
- 5 well thought out but albeit bolted on solutions to a prior
- 6 structure.
- 7 I'm very optimistic. We try and maintain the
- 8 current structure, we try to ignore the fact that there are
- 9 state policies, there are new technologies. New York's REV
- 10 is just an example of that. We are going to talk about
- 11 markets and sometimes the term markets has been played to
- 12 fairly administer wholesale markets but this room is awash
- 13 with not just market participants but people who operate in
- 14 various markets.
- 15 NYSERDA -- my colleagues and I will talk about
- 16 it, operates a central procurement competitive mechanism for
- 17 us to get the environmental attributes which is at the heart
- 18 of our state policy. We are in the midst is a cornerstone
- 19 of REV, a developing a distribution level market that will
- 20 need to interface with the wholesale markets.
- 21 So to answer the question is there a role for the
- 22 wholesale markets? Absolutely. Is it going to change --
- 23 probably but I don't want to sit here and try and take out
- 24 my scalpel and say how would I surgically adjust things
- 25 today. If nothing else comes from this Conference I hope it

- 1 is that there is something that we are doing on Wednesday,
- 2 there's something that we are doing to continue the
- 3 discussion that happens today.
- 4 And I just want to close for the
- 5 moment and say that there is a lot of good work going on at
- 6 the regional market level. Tomorrow my team and Janet's
- 7 team together with Brad Jones's team will be taking a look
- 8 at an idea that has been developed at the NYISO.
- 9 We don't know whether it is something that can be
- 10 supported or should be supported or should be evolved. What
- 11 we do know is we have to turn over the stone. We have to
- 12 work together to see what that -- what possible solutions
- 13 are.
- 14 But I also think there's a role for the federal
- 15 agency and I put that in my remarks. I think the federal
- 16 agency can be a convener of those of us who work at the
- 17 state level within each of the three federal markets and
- 18 that could be a starting point because we need to find
- 19 commonality.
- 20 We need to be able to identify those first
- 21 principles and sometimes that exercise feels very touchy
- 22 feely but I just simply don't know how we are going to get
- 23 an answer that is going to prevent us from being back here
- 24 having this exact same discussion a year or two from now
- 25 unless we start with both a recognition that things have

- 1 changed and we need to develop first principles.
- 2 MR. OUINN: Janet?
- 3 MS. JOSEPH: Alright well let me try to build
- 4 upon that. First of all thank you very much for inviting us
- 5 to participate in this session. We do believe this is a
- 6 very important dialogue and one that we will need to
- 7 continue. NYSERDA for those of you who may not be familiar
- 8 with the organization -- we are the clean energy
- 9 organization in New York state we are not the regulators.
- 10 That is the purview of our colleagues at the Department of
- 11 Public Service and we work very closely together to design
- 12 our policy structures and implement our programs.
- 13 NYSERDA is also the chair of the Energy Planning
- 14 Board and so we are involved in designing policy and in
- 15 implementing a number of the programs that are being
- 16 developed under the reforming the energy division framework.
- 17 In doing this we work with a range of energy
- 18 market participants from utilities to new technology
- 19 solution providers to researchers, clean tech companies,
- 20 financers, consumers as well as the market participants that
- 21 are in this room.
- 22 And it is very clear that the energy landscape is
- 23 changing and we have distributed energy resource technology
- 24 today that we only dreamed of back in the early days when we
- 25 were restructuring the industry.

- 1 We are seeing prices come down in distributed
- 2 energy resources and renewable energy. We are seeing
- 3 expression of customer preference changing. We are seeing
- 4 some customers who want more green products or more secure
- 5 long-term visibility into price.
- 6 We are seeing new solutions for resiliency and we
- 7 are even seeing some new business models that we believe can
- 8 open up clean technology to new classes of consumers. So my
- 9 message here is certainly agreeing with the earlier panel.
- 10 The market is changing, our energy landscape is changing.
- 11 Our policy construct is changing and that will no doubt
- 12 affect the markets.
- 13 Now these changes that I just went through are
- 14 positive generally they are positive. But from a policy
- 15 perspective in New York we still do not see kind of business
- 16 as usual evolution to be sufficient to address our energy
- 17 policy challenges.
- 18 So when we look at energy I am going to cite Sue
- 19 Tierney's remarks. She talked about solving simultaneous
- 20 equations. We are trying to solve an equation that's going
- 21 to build and increasingly resilient energy system given
- 22 extreme weather events, given an aging infrastructure.
- 23 We want a more dynamic flexible system that's
- 24 capital efficient. We need to develop clean transportation
- 25 systems so when we look at our clean transportation future

- 1 it is linked to our electric system and we need to think
- 2 through all of that.
- 3 And yes we need to reduce greenhouse gas
- 4 emissions and preserve the quality of our environment. And
- 5 then all of this needs to be done while maintaining
- 6 affordability and driving system wide savings and value to
- 7 customers.
- 8 So there are multiple things in our policy
- 9 framework that we try to solve for and I think that's very
- 10 critical to understand from the state perspective. So the
- 11 economic efficiency of the wholesale power market is one
- 12 piece of our energy equation, we view it as a very important
- 13 piece of the equation in addition to these other elements
- 14 that we are trying to solve for.
- 15 Many of you may be familiar with the policies
- 16 that have been established in New York State. We have a
- goal to reduce greenhouse gas emissions by 40% by 2030.
- 18 We have a goal to transform the electric
- 19 generation sector such that half of it by 2030 will come
- 20 from renewable resources and we have an energy efficiency
- 21 goal that's an all fuel goal to reduce energy consumption in
- 22 buildings by 23%.
- Now you know when we look to the future there is
- 24 no doubt uncertainty in the technology evolution and the
- 25 pace of the emergence of these distributed energy resource

- 1 technologies and solutions and the pace in which we develop
- 2 these retail markets that REV is so aggressively focused on.
- 3 So given that -- given that uncertainty, given
- 4 that none of us can predict the future we believe it is very
- 5 important for states to have the ability to develop the
- 6 policies in collaboration with the local markets with
- 7 customer preference in mind, with stakeholders to meet the
- 8 policy objectives as well as the system requirements.
- 9 So we do see wholesale markets as a critical part
- 10 of this but one part of our integrated energy policy
- 11 framework. And our roadmap in New York State for an
- 12 integrated energy policy framework is laid out in our state
- 13 energy plan which is statutorily required.
- 14 So I guess in closing I certainly concur with my
- 15 colleague that we look forward to collaboration with FERC
- 16 with our New York ISO. We believe we will have to resolve
- 17 how these markets and policy objectives will work into the
- 18 future. We do have a new emerging energy system today
- 19 that's different from the one that we designed back in the
- 20 mid '90's and we all need to be cognizant of that.
- 21 So I look forward to continuing the collaboration
- 22 and again thank you for inviting us here today.
- MR. QUINN: Susanne?
- 24 MS. DES ROCHES: Thank you. And I want to thank
- 25 the Commission for extending the invite to a locality. So

- 1 the city of New York is happy to participate in this. So
- 2 one thing that I have been reflecting on as I have been
- 3 listening to the other panelists is really the why are we
- 4 here and how does it affect people and how does it affect
- 5 our economy?
- 6 So when we govern at the local level right -- we
- 7 do a lot of thinking about that. How do we make people's
- 8 lives better and at the local level in New York we are
- 9 seeing the effects of a changing climate today. We are
- 10 getting hotter right -- so just a couple of interesting
- 11 notes on that.
- 12 450 emergency room visits every summer as well as
- 13 150 hospitalizations due to heat. We see approximately 13
- 14 deaths a year and this is in a climate that is going to
- 15 continue to get hotter. We have 115 access deaths so these
- 16 are folks that die of natural causes but that are
- 17 exacerbated by heat.
- 18 So when we talked earlier about urgency, this is
- 19 really at the local level we are dealing with issues today
- 20 that we expect to get worse. Energy plays a big part in the
- 21 solution. Sea levels are also rising. We saw a foot of sea
- 22 level rise since 1900. We saw the devastation of Sandy --
- 23 44 lives lost in New York City -- 19 billion dollars in
- 24 damages and economic losses from one event.
- The climate is changing, we are anticipating

- 1 these events to happen sooner and our electricity, our
- 2 source needs to adjust so that we can provide solutions to
- 3 what we see coming. So New York City has been our leader in
- 4 both mitigating greenhouse gases and adapting to a changing
- 5 climate.
- 6 We also have a series of goals 80% reduction of
- 7 greenhouse gases by 2050 but I would argue that we are not
- 8 talking about an environmental issue, we are talking about
- 9 an economic issue and we are talking about our livelihoods
- 10 and we are talking about our future.
- 11 Effects in New York City have a global reach and
- 12 that's a serious issue and we take that very seriously. In
- 13 the energy sector which plays a large role in this equation,
- 14 we need to use all of the tools that we have and we need to
- 15 innovate. And so we support wholesale markets.
- 16 We also want to use our energy efficiency goals,
- 17 our distributed generation that will bring us clean and
- 18 resilient energy sources at a local level. We need large
- 19 scale renewables and additional transmission to get those
- 20 renewables to New York City.
- 21 We are going to electrify as we have heard
- 22 earlier. We are electrifying transportation goals and we
- 23 need fuel diversity as well as we move closer and closer to
- 24 natural gas as our main fuel source we think renewables will
- 25 play an excellent balancing role to that fuel supply.

- 1 So in New York City we have the 80% in city
- 2 generation as a rule. 76% of our units will be 50 years or
- 3 older in 5 years-time so we have a very aging fleet. And as
- 4 we look at how the market works we believe we are not
- 5 incentivizing repowering of those units.
- 6 We understand that we will need fast ramping
- 7 technologies to balance out our renewable goals in the city
- 8 and so we would like to see repowering happening quickly.
- 9 We are also committed to 100% of New York City's power to be
- 10 renewable and we will work to meet those goals.
- 11 So in closing I would like to just say that I
- 12 echo what my other panelists talked about, about a
- 13 collaborative process. We support the wholesale markets but
- 14 we see that innovation is needed and we would -- especially
- 15 at the local level where we are already seeing these impacts
- 16 happen today we need to figure out a quick path forward -- a
- 17 Wednesday path forward as mentioned earlier to start to
- 18 integrate these innovations, thank you.
- 19 MR. MORENOFF: Thank you all. A couple of
- 20 questions following up on that -- in light of the changes
- 21 that you noted in the energy landscape and beginning Mr.
- 22 Weiner with your prepared remarks where you had noted that
- 23 premier prospective states that settled jurisdiction with
- 24 respect to a number of topics including both resource
- 25 adequacy and reliability.

- 1 Noting your support for the wholesale markets
- 2 what do you see as the substantive contribution that
- 3 wholesale markets make particular at capacity market and I
- 4 guess correspondingly what do you see as the substantive
- 5 role that FERC should have if it goes beyond the convener
- 6 role that you were describing?
- 7 MR. WEINER: FERC has a clear role in terms of
- 8 the administration of wholesale markets. And again I want
- 9 to avoid conflation because we think about the federally
- 10 administered wholesale market sometimes we have to think or
- 11 I try to think about them separately and not conflated.
- 12 So the energy market I think will always be
- 13 there. The capacity market as the Chair noted may not be.
- 14 There are models where it doesn't exist. And I don't want
- 15 anybody to read that either I individually and certainly not
- 16 the states advocate that.
- 17 But that's our spectrum of outcomes and I think
- 18 as we sit down and try and identify what are our first
- 19 principles we will be able to see what the role plays. And
- 20 I think it can play a role. But possibly -- not an
- 21 exclusive role in dealing with entry and exist -- maybe
- 22 heavily burdened from one group to the other.
- 23 But I will and it should come as no surprise that
- 24 we have a belief -- I have a belief that the current
- 25 operation of the markets with the buyer's side mitigation is

- 1 not supplied, not just New York but throughout the region,
- 2 that issues of the MOPR and how that is supplied not just in
- 3 New York but throughout the region creates a complex
- 4 labyrinth that really our colleague Richard Kauffman in New
- 5 York talks about not just in this setting but in the entire
- 6 energy setting, the bolting on to old historic structures.
- 7 And we have tried to start again with REV and
- 8 looking at REV we started the customer. And I want to take
- 9 exception with anybody who thinks that the state or a city
- 10 isn't finely attuned to customer needs. We can't do it by
- 11 ourselves but again this is an area of cooperation rather
- 12 than presumption.
- 13 We try to acknowledge emerging technologies but
- 14 what's hard is the deployment of DER. At its heart is
- 15 recognizing that load can now be a resource. So we are
- 16 doing thing in New York -- we just adopted as you probably
- 17 know, the Commission did, a new methodology to value and
- 18 compensate DER resources which among other things is going
- 19 to lead to the elimination of any new enrollment and net
- 20 metering as a mechanism as of January 1, 2020 and it's
- 21 continuing today only for on-site mass market applications.
- That was based upon a common shared principle of
- 23 the importance of accurate pricing. And without wanting to
- 24 be facetious who could argue against accurate pricing? The
- 25 reason it became so important to us is not just because it's

138

- 1 a virtue but because by having accurate pricing that can
- 2 identify the different values, that different DER will bring
- 3 at different moments in time and at different locations.
- 4 It will send price signals to people to invest in
- 5 it and to deploy it and to make it available as a resource.
- 6 Now all of that and all that surrounds that has to couple
- 7 with what's taking place in the wholesale market and it was
- 8 about a year or so ago that my colleagues -- Brad's
- 9 colleagues began the conversation it was put on a bit of a
- 10 hiatus because of other matters, but that's something else
- 11 that's coming up.
- 12 And I want to end now just by acknowledging the
- 13 beginning of Brad's formal statement where he noted
- 14 historically the things that we have done together. And I
- 15 think if we step back and look at why are we succeeding
- 16 there and why is it so difficult in other places?
- 17 Part of it is I think the changing paradigm the
- 18 need to recognize that but it is also because we started
- 19 with some first principles, we had very clear objectives.
- 20 This part is not rocket science but if we don't deal with
- 21 those fundamentals we just get into this continuous
- 22 conversation.
- 23 MR. QUINN: See I want to make sure our
- 24 Commissioners have a chance to ask questions.
- 25 CHAIRMAN LA FLEUR: Thank you very much to all of

- 1 you for being here, it would seem on the surface that a one
- 2 state ISO in a one state ISO dealing with reconciling state
- 3 policy and how markets are designed should be easier because
- 4 you are not dealing with multiple states with different
- 5 policies.
- 6 In his pre-filed testimony Brad Jones suggested
- 7 that if the state defines the attribute or attributes it
- 8 wants the markets can price that which seems reasonable. Is
- 9 that something you want? I'm interested in what you are
- 10 looking for from the market. I mean are you looking for
- 11 help for new entry? Is it just about pricing existing
- 12 generators because the market is right there in your state,
- 13 you should be able to use it to price what you want if we
- 14 know what you want?
- 15 MR. WEINER: Well I think it is part of knowing
- 16 what we want, that's part of our obligation to articulate.
- 17 But in fairness Commissioner I believe that the state
- 18 policies are fairly clear.
- 19 Earlier today we have also heard some I think
- 20 fundamental principles from a state's perspective. A state
- 21 is not going to seek sovereignty and I'll acknowledge that
- 22 nobody is asking it to do so but there is a big difference
- 23 of -- I forget the phrase that was used, creative I'll call
- 24 it effective federalism where we come together as peers
- 25 there's a recognition that there are boundaries and there

- 1 are responsibilities.
- 2 And that we work together to see how can it be
- 3 solved. I can think of lots of scenarios where federal
- 4 wholesale markets can make a very valuable contribution to a
- 5 state's energy policy. I don't know that that's been the
- 6 case today not because anybody lacks the intent but I'll go
- 7 back to the bolting on of tried and true tools on a
- 8 framework that may need to be retired itself.
- 9 So I want to make it very clear there's a role,
- 10 we believe in markets, we believe in markets as a generic
- 11 concept. We believe in the federal wholesale markets.
- 12 Capacity gets us a little concerned but that is not a
- 13 surprise.
- 14 We need to work together to figure it out and I
- 15 do believe that some months of conversation between the ISO
- 16 and its staff and its Board and the Commissioners and other
- 17 energy leadership throughout the state and its constituents
- 18 has brought this to a point in New York where we have that
- 19 opportunity and that all starts tomorrow.
- 20 CHAIRMAN LA FLEUR: Thank you, when I read your
- 21 testimony I thought maybe we had found a new topic for FERC
- 22 church in the FERC collaborative but what I am trying to get
- 23 a sense of is the urgency you feel. Because I feel like I
- 24 am listening to a long discussion of new principles and you
- 25 have credits taking affect in your market if memory serves

- 1 next month -- it's May now right, so next month.
- 2 And that's imbuing some people with a sense of
- 3 urgency to figure out how we are going to incorporate that.
- 4 What is your sense of urgency to figure out this issue?
- 5 MR. WEINER: Well number one I think from a state
- 6 point of view we developed a framework which is very
- 7 effective that can stand on its own. I know that's not a
- 8 view that is shared universally.
- 9 But now with the feeling I think there is an
- 10 urgency. There's an urgency because there are other issues
- 11 around the corner and while the disputes continue to exist
- 12 as you pointed out in a purely adversarial form that we are
- 13 not able to have these discussions.
- 14 And I will admit my filter -- as you know I was
- 15 an Environment and Energy Commissioner in Jersey literally a
- 16 generation ago. But there we had with the EPA and there we
- 17 were wrestling with the implementation of the Clean Air Act
- 18 back in 1990.
- 19 And the EPA convened something that was very
- 20 directly called the State EPA Committee Policy, period full
- 21 stop. It consists of the administrator, the administrator's
- 22 key staff and a set of representatives from states around
- 23 the country.
- 24 We talked to each other. It became the basis of
- 25 further collaboration and New York will be talking a lot

- 1 internally. But I do think that there is a role for this
- 2 agency to continue these kinds of discussions.
- 3 CHAIRMAN LA FLEUR: That's what today is for.
- 4 The opportunity to talk about things that are ex parte and
- 5 in court lawsuits is hard day to day, yes?
- 6 MS. DES ROCHES: So going back to some of my
- 7 earlier comments around urgency one thing I didn't discuss
- 8 was the valuing of public health benefits which we currently
- 9 do not see. Certainly at the local level we don't see the
- 10 markets valuing a public health benefit.
- 11 So we legislated the reduction of heavy fuel oil
- 12 in New York City. And since 2009 we have seen an 18%
- decrease of PM 2.5 locally as buildings and generators but
- 14 this is a place where we legislated because the market was
- 15 not incentivizing a switch from heavy fuel oil.
- 16 That has avoided on a yearly basis 100 premature
- 17 deaths and 250 emergency room visits and hospitalizations.
- 18 So from our perspective the market was not stepping in and
- 19 incentivizing a public health benefit.
- 20 Clearly we have an issue in New York City with
- 21 older generation and that re-powering is not happening
- 22 urgently. So the state has announced that Indian Point will
- 23 be closing in 2021-2022 with a possible extension. We think
- 24 that that is potentially going to increase in city
- 25 generation at a point in which those units will be 76% 50

- 1 year old and greater.
- 2 There's another area where the market and we can
- 3 get into by your side mitigation but the market has an issue
- 4 that's not being resolved that we think is extremely urgent.
- 5 CHAIRMAN LA FLEUR: The market will do what you
- 6 decide it to do which is back to first principles.
- 7 MS. JOSEPH: One thing I'd like to add with
- 8 respect to this -- I'll call it the urgency timing
- 9 dimension. If we talk about a collaborative where an end
- 10 goal might be achieving the goals I think the first place we
- 11 have to start is to sort of assess the situation and see
- 12 where we have created obstacles and roadblocks where maybe
- 13 our policies are conflicting.
- 14 Address those first they are probably easier to
- 15 fix while we work toward you know building perhaps a more
- 16 harmonized system that reflects the current energy system
- 17 that we have in current energy policy goals.
- 18 So I wouldn't overlook those opportunities to fix
- 19 some of the problems that have emerged and I am not a market
- 20 design expert but things such as by your side mitigation and
- 21 the MOPR we shouldn't gloss over those we should see if we
- 22 can make progress.
- 23 The other thing I will put on the table from the
- 24 standpoint of achieving our renewable energy goals --
- 25 interconnection is a very big process. It's a very big

- 1 issue and it is a challenge -- it will be a challenge as
- 2 well as siting in your state so there may be opportunities
- 3 working collaboratively with our ISO's with FERC to improve
- 4 the large facility interconnection procedures and
- 5 requirements.
- 6 And that can actually help us in the near term
- 7 from an urgency standpoint that could really help us.
- 8 COMMISSIONER HONORABLE: I want to thank you for
- 9 your pre-filed comments. I think taken together very nicely
- 10 and eloquently depict how not only busy but successful you
- 11 have been in New York and we certainly have continued to
- 12 look to you to lead. And we learn from you quite honestly
- 13 even though you are a single state RTO or ISO.
- 14 So I want to congratulate you on your work. And
- 15 I also want to encourage you all, and particularly you
- 16 Susanne to continue to remind us about the impact of this
- 17 work and why we are doing this work in the first place.
- 18 And I say that even as this Commission will
- 19 change and we will in the same way that we continue to have
- 20 to educate law makers and constituencies -- yes you have to
- 21 continue to educate us regulators as well. So it is very
- 22 important that you continue to put into the record that
- 23 important message about the impact of this work not only
- 24 today but tomorrow.
- 25 The question I have for you is something that

- 1 Cheryl mentioned. I don't want to put you on the spot today
- 2 but I want to urge you to consider in your work with the New
- 3 York ISO what is the objective that you want wholesale
- 4 markets to achieve, both energy and capacity markets.
- 5 And I think Miss Joseph you nicely made very
- 6 clear market -- wholesale markets are one part of New York's
- 7 plan for how it is attacking energy challenges, addressing
- 8 them and planning for the needs of your people. So the
- 9 answer to that question in my mind and I think Mr. Weiner
- 10 has really hit on it -- it's the identification of that. We
- 11 are singing from the same hymn book there.
- 12 Amen -- I'm from the South so I say Amen all the
- 13 time. I also want to urge you and I want to thank you for
- 14 your openness to be willing to consider new and different
- 15 proposals. I think we will hear and we have read in the
- 16 comments your work with the New York ISO, although in its
- 17 infancy could be a potential solution for you and I
- 18 appreciate that you are looking for new and different ways.
- 19 I don't disagree with our acting Chair's four
- 20 doors if you will. I have espoused them differently I think
- 21 in the way that I speak with people. I too would rather
- 22 that we arrive at a solution collaboratively and not through
- 23 years of protracted litigation.
- 24 But I am also open to the ideas that you are
- 25 bringing and that's why I'm particularly encouraged by this

- 1 news about this new effort along with the battle groups,
- 2 I'll be looking forward to and encouraging you guys along
- 3 the way, thank you.
- 4 MR. QUINN: I'll just ask maybe a follow-up
- 5 question. I have heard in the comments so far a suggestion
- 6 that most of the new resources -- the state and the city
- 7 want the flexibility both to bring new resources because
- 8 there is a changing paradigm.
- 9 Distributed resources perhaps, renewable
- 10 resources perhaps bring new resources on -- powered
- 11 resources but also potentially manage exit as well. So you
- 12 know I think for the earlier session we talked about maybe
- 13 the role the capacity market as being -- whether or not the
- 14 role of the capacity market was to organize exit of
- 15 resources and accept that state and local policies would
- 16 dictate where the new resources were going to come from.
- 17 I heard some of the comments here as being maybe
- 18 you would like to manage exit as well. And so I guess
- 19 ultimately and this is probably a stark question -- is there
- 20 really any role left over for the capacity markets at all or
- 21 is kind of the future that you had envisioned one where the
- 22 state would dictate through the various policies where all
- 23 new resources are going to come from, which resources would
- 24 retire and then the energy markets will just on a day to
- 25 day, hour to hour basis find the least cost dispatch?

- 1 MR. WEINER: It'll end the same way it began --
- 2 it depends. And I don't mean to be as evasive as I know
- 3 that sounds. But I think if we start with what the
- 4 objective is, what are the tools that we all have at hand --
- 5 how might a capacity market operate? What would the
- 6 underlying assumptions be?
- 7 What are the problems that the administrators of
- 8 the wholesale capacity market have to face? What are their
- 9 obligations? Then we can find out whether there's room. I
- 10 mean right now today the state DPS and then the PSC are the
- 11 recipient of Petitions of incumbent sources whose attribute
- 12 contracts are coming to an end and they want to continue.
- 13 And we are being faced with some of those
- 14 questions today and the question of when is the right set of
- 15 circumstances that the state should step in and operate a
- 16 maintenance tier if you will. And the CES is adopted by our
- 17 state Commission has that Tier 2 and we are about to start a
- 18 proceeding to look at what the rules of engagement will be
- 19 for that Tier 2.
- 20 So I think not saying that this is something that
- 21 we want to exclusively hold on to but again there are issues
- 22 that are being brought to us because of what I would
- 23 describe as the "bolted on". We kept building additions,
- 24 additions, additions. Now I think it would be really
- 25 interesting and even critical for us to sit down together

- 1 and say what's the problem we are trying to solve?
- What are the benefits that a centrally
- 3 administered wholesale capacity market could bring to
- 4 solving that problem and how can we do it? And I can assure
- 5 you that when that conversation is held in recognition of
- 6 state sovereignty and state responsibility and state
- 7 commitment, we are going to be your partner.
- 8 And I know that when we recognize that there are
- 9 obligations, there are boundaries, that the federal
- 10 wholesale markets if recognized at capacity market is going
- 11 to have to operate and we will find that way or we will
- 12 collectively decide maybe there's a better way.
- 13 What I do know is the status quo can't be
- 14 maintained much longer and if that happens we get to I think
- 15 two points. The fourth door if you will, Commissioner
- 16 LaFleur and also Sue Tierney's conclusion. That's not our
- 17 objective. The federal wholesale markets are a tool, they
- 18 are a resource, they are an asset that I think are being
- 19 under used right now because they are being burdened by a
- 20 structure that doesn't reflect today's economic reality.
- 21 MS. DES ROCHES: So just to add on a bit to what
- 22 Scott said. So we also would like this to be a
- 23 collaborative process and a plan to change. Definitely
- 24 advocating from the local level that you look at what the
- 25 local needs are and you look at why we are using public

- 1 policy in the way that we are to best serve our
- 2 populations.
- 3 So that we come to the table with our
- 4 perspective, the markets come to the table with their
- 5 perspective and we try to meet somewhere in the middle.
- 6 Right it can't be a zero-some game we all have to meet in
- 7 the middle. I think it is very important that it isn't just
- 8 about how the models work and how they were constructed but
- 9 that we are really talking about the tangible outcomes, yet
- 10 I haven't heard a lot about affordability today but you know
- 11 the tangible outcomes to the folks that live in our states
- 12 and our cities and how do these policies and this change
- 13 that needs to happen to the market going to affect them?
- 14 And if we can come to the table in a
- 15 collaborative process that has all the voices at the table
- 16 we will have a better outcome.
- 17 MR. QUINN: I think we hit our hard stop of
- 18 12:37. I appreciate your comments and look forward to
- 19 having to bring you back on our side panel for our session
- 20 after lunch. We will try to come back at 11:30 -- I'm sorry
- 21 1:30 for our second session.
- 22 AFTERNOON SESSION
- 23 SESSION II
- 24 Panel 2
- 25 MR. QUINN: Alright we're going to get started --

- 1 too much power. So welcome back to the second panel of the
- 2 second session. We are going to follow pretty much the same
- 3 goals and format as we followed for the first session. I'll
- 4 remind the state participants and the local participants
- 5 that if you would like to talk during the panel please put
- 6 your tent card up.
- 7 I'll remind our panelists that we are looking for
- 8 an open dialogue and we have all read your testimony so you
- 9 know to the extent that we can avoid opening comments in the
- 10 form of the answer to the first question that would be
- 11 great. I would like to welcome our panelists and introduce
- 12 them starting out with Brad Jones the President and Chief
- 13 Executive Officer of New York ISO.
- 14 David Patton, President of Potomac Economics,
- 15 Kathleen Barron who is the Senior Vice President of
- 16 Competitive Market Policy at Exelon, we have James Holodak,
- 17 Vice President of Regulatory Strategy and Integrated
- 18 Analytics at National Grid.
- 19 Next we have John Reese Senior Vice President of
- 20 Eastern Generation. Oh I skipped over -- I'm sorry, Mark
- 21 Kresowik the Regional Director of Beyond Coal Campaign,
- 22 Sierra Club and then finally John Shelk, the President and
- 23 Chief Executive Officer of the Electric Power Supply
- 24 Association.
- 25 So I think we heard in both the pre-Conference

- 1 comments and statements but also the discussion we had for
- 2 the first panel -- a discussion about how New York State is
- 3 transitioning to a new energy environment and an energy
- 4 environment that certainly is focused on the REV process, an
- 5 increased role for distributed energy resources, a renewed
- 6 focus -- an increased focus on clean energy.
- 7 So I think what we would like to understand from
- 8 all of you is in the transition from where we are today to
- 9 where New York State believes its going. One -- do you have
- 10 a sense for how long that transition is going to take?
- 11 And two -- how do resources and market
- 12 participants make decisions along that transition path in an
- 13 orderly way so that the existing set of resources that are
- 14 needed during the transition but maybe are going to need to
- 15 fall out at the end -- know what their time for staying in
- 16 their time for going is.
- 17 And is there a way for the market rules that New
- 18 York ISO runs to help with that transition period. So maybe
- 19 just have folks you know if you would like to talk put your
- 20 tent card up and we can kind of go to the first person with
- 21 the coherent thought.
- There you go John Reese.
- 23 MR. REESE: I'm not necessarily coherent. So
- 24 it's a real dichotomy going on, on how long because we have
- 25 varying goals as you have heard. You know probably the

- 1 longest term goal is 80% by 2050. We have 40% renewable
- 2 energy by 2030 and then we have some interim goals in
- 3 between.
- 4 And you know look this is a long -- this is a
- 5 marathon that New York, my entire career in and out of
- 6 public service in New York has been about de-carbonization
- 7 since we have added environmental externalities of \$14.00 a
- 8 megawatt hour in 1989. This isn't anything new. We know
- 9 how to do this. There are systems in place.
- 10 For the last 19 years the market has been able to
- 11 respond to New York's environmental issues and the
- 12 environmental goals. If this is about carbon in our view we
- 13 can do that. It can't be about multiple prices of carbon
- 14 for the market to respond. The market is very good at
- 15 responding to the signals you have heard from a bunch of
- 16 people.
- 17 Those are the long-term issues and we need a
- 18 model that gets us to that long-term transition. What does
- 19 it look like in 2040? We also need to know what it looks
- 20 like in 2023 and 2024 and that's the challenge because we
- 21 are facing some additional environmental challenges that
- 22 aren't on the table today due to regulations affecting NOCKS
- 23 and peakers in New York City we are likely to see 3,000
- 24 megawatts in Zone J and K be at risk.
- 25 This is the aging infrastructure that's what I

- 1 am. So the challenge on how soon do you need to act. I
- 2 need a signal. Indian Point -- I need a signal. The market
- 3 can respond but without FERC action, without the New York
- 4 ISO action with a simply a regulatory action I have no way
- 5 for investment. I'm backed by equity investors.
- 6 We need that signal unlike New England this
- 7 morning and PGM this afternoon I don't have a 3 year forward
- 8 market I have a one month market. In the month of May we
- 9 saw the impact of ZECS. There was no impact of ZECS in the
- 10 market in April.
- 11 The capacity price went to a 6 year low. I can't
- 12 wait for 7 years or 8 years for this to work out regardless
- 13 of what model we end up with. We need to be sending
- 14 investment signals now.
- 15 MR. HOLODAK: We appreciate FERC facilitating
- 16 these discussions and thanks for the opportunity to be able
- 17 to share our opinions today. The national grid operates in
- 18 both the ISO New York/New England markets. We are
- 19 absolutely supportive of the state's goals in trying to
- 20 reduce carbon emission allowance emission.
- 21 How's that better? We absolutely support the
- 22 state's goals whether they be 40 by 30 or 80 by 50. What's
- 23 interesting though in order to achieve those goals the
- 24 generation sector can't do that alone. Roughly a third of
- 25 emissions come from transport, a third come from heating --

- 1 residential, commercial heating and then the third comes
- 2 from the generation system.
- 3 So remember for states to meet an 80 by 50 goals
- 4 it's got to be an all-encompassing -- it has to affect each
- 5 one of those aspects even if the generation sector were to
- 6 go 100% renewable you would still probably only get halfway
- 7 to where you need to be.
- 8 So with that said some folks earlier today
- 9 indicated that they were focused on transport, on
- 10 electrification of heating, all of that will tend to
- 11 increase the load further than what we have today and I
- 12 don't know that more focus on energy efficiency will help
- 13 reduce that to keep the load flat without growing.
- 14 So I think it is incumbent and we are hopeful
- 15 that we can come to a solution that still involves the
- 16 wholesale markets. I don't know that national grid is all
- 17 that happy about the mandated obligations put upon it
- 18 through contract or otherwise. So to the extent that we can
- 19 solve these through wholesale markets as opposed to what I
- 20 like to call virtual ownership having the utility being
- 21 mandated to enter into a contract with a renewable
- 22 generator.
- To me all that does is shift the burden of
- 24 financing from that developer to the utility and its
- 25 customers. So we have got virtual ownership of the asset

- 1 without really having any of the benefits of it or the
- 2 terminal value of it.
- 3 So we are hopeful that rather than working
- 4 through say 1 off or 5 off or 10 off mandated RFP's and
- 5 PPA's that we could find a way to price things into the
- 6 wholesale market, price those carbon attributes or
- 7 environmental attributes that all of the states are
- 8 interested in into the wholesale market and see if we can't
- 9 come up with a solution that way.
- 10 Now you can't necessarily do that if the states
- 11 are honing in on one particular type of asset or another so
- 12 if the goal is clean energy and environmental attributes
- 13 then that ought to be the goal and we ought to be able to
- 14 price that into the market and let innovation and
- 15 competition bring the solutions about.
- To Scott Weiner's earlier point New York is
- 17 designing a distribution platform that can do that at the
- 18 distribution level, that sends the correct pricing signals
- 19 to entice people into the market I can't fathom why the
- 20 wholesale markets can't do the same thing.
- MR. QUINN: Brad?
- 22 MR. JONES: Thank you. Arnie I didn't like your
- 23 question so much but I did like the answer that came up from
- 24 Jim from our play-off of that one. Jim has talked about the
- 25 40 by 30 goal. Now that is a 40% reduction of carbon from

- 1 1990 levels by 2030 economy-wide.
- Now he mentioned that. In the electricity sector
- 3 alone with state policies that have driven us toward a more
- 4 efficient and lower carbon grid, the NYISO markets have
- 5 delivered significantly on that goal already.
- 6 In the electricity market alone there is a 50%
- 7 reduction in carbon from 1990 levels. But that is not
- 8 enough and Jim we have to do more. The reason why the
- 9 transportation sector as Jim mentioned continues to show
- 10 increases in carbon output. So as the transportation sector
- 11 grows we have to get more reductions out of the electricity
- 12 sector.
- 13 That is where the State of New York has acted.
- 14 And the two things that they have passed under the Clean
- 15 Energy Standard they have acted to number one -- drive more
- 16 renewables into the grid, a goal of 50% of renewable
- 17 production in 2030.
- 18 And number two -- to preserve nuclear units that
- 19 can help maintain that clean energy balance at low carbon
- 20 balance. Now why did nuclear generation need support?
- 21 Because the wholesale markets that are operated by the NYISO
- 22 are at record low prices and those record low prices have
- 23 put these nuclear plants at economic jeopardy -- jeopardy of
- 24 leaving our system.
- 25 So the states stepped in as a bridge to the

- 1 future, an opportunity to retain those units which gets to
- 2 part of your question about how quickly do we react -- a
- 3 bridge into a future that we see for moving towards these
- 4 lower carbon solutions.
- 5 Now the NYISO ha supported the ZEC program but we
- 6 have been very specific that we believe it needs to move
- 7 into a competitive environment -- that the wholesale markets
- 8 can resolve this problem.
- 9 So we have been working collaboratively with the
- 10 state and with our market participants and I think Colette
- 11 you mentioned or perhaps it was you Cheryl mentioned that
- 12 collaborative is our new church word. We are going to
- 13 change it to partnership because of that.
- 14 We are in a partnership with the State of New
- 15 York and with our market participants to try to find a
- 16 solution for how we can integrate the price of carbon into
- 17 our markets. We believe it can be done but we have to test
- 18 our assumptions, we have to run the sensitivity analysis, we
- 19 have to know that this is the right pathway for the State of
- 20 New York. So we are in the middle of that process. We have
- 21 hired Brattle group who is doing that analysis. Brattle
- 22 will be here tomorrow so if you have specific questions on
- 23 the program I would be happy for you to ask them.
- 24 However, the results so far are very preliminary.
- 25 They are promising though. We believe that there is an

- 1 opportunity for us to incorporate carbon directly into our
- 2 markets. Ultimately what we are looking for is a model
- 3 which will meet the full goal of reliability, low cost, low
- 4 carbon output and finally and also importantly a balance
- 5 between state and federal jurisdictions.
- 6 If we can achieve all of those elements I think
- 7 we have a process that will work.
- 8 MR. QUINN: Mark?
- 9 MR. KRESOWIK: I want to echo the thanks for
- 10 inviting me to speak here today. I think New York has sent
- 11 the right long-term policy signals as Johns said earlier in
- 12 terms of this 50% by 2030 Clean Energy Standard, 40% by 2030
- 13 the economy-wide carbon target and the Regional Greenhouse
- 14 Gas Initiative which has certainly gotten some air time here
- 15 today, a fantastic collaborative of the 9 states in the
- 16 Northeast to price and reduce carbon pollution.
- 17 At the same time I think what you are
- 18 highlighting is a misguided policy that New York engaged in
- 19 to intervene in a resources decision to exit the market
- 20 which results and will result in consumer prices in some
- 21 cases being higher than they should be. But I want to maybe
- 22 play off Scott's earlier example where he talked about
- 23 operating with a scalpel.
- 24 I come from a medical family and so would remind
- 25 the staff and the Commissioners of one of the first

- 1 principles of a medical practice which is, do no harm --
- 2 first do no harm. And so I think that many of the ideas
- 3 that have been put forward in neighboring jurisdictions we
- 4 haven't seen yet what New York ISO specifically is going to
- 5 propose, but many of the proposals in ISO New England and
- 6 PJM would in fact do more harm than they would help. The
- 7 cure would be worse than the disease.
- 8 So I think it is very important that when we look
- 9 at accommodation as was discussed earlier it should start by
- 10 not doing more harm than good which means first limit the
- 11 minimum offer price rule to situations that violate federal
- 12 law. Don't expand the minimum offer price rule increase as
- 13 we have seen in ISO New England.
- 14 And in fact even well intentioned ideas such as
- 15 carbon pricing as New York ISO is working on with the
- 16 Brattle group would have the unintended consequence of
- 17 actually undermining the region of Greenhouse Gas Initiative
- 18 which certainly Dr. Patton there highlighted earlier as the
- 19 preferential way to go about pricing carbon.
- 20 So I think it is very important that whatever we
- 21 do -- whatever New York chooses to do in reaction to
- 22 generator decisions potentially to exit does not do more
- 23 harm than good.
- 24 MR. QUINN: Thank you we are going to do David
- 25 and then John and then we will go to Scott the next time.

```
1 MR. PATTON: Okay so you have heard me express
```

- 2 some opinions let me clarify one thing. I'm not pessimistic
- 3 in general at all potential -- only about achieving
- 4 consensus among everybody and what the objectives are.
- 5 But I think actually they are -- I'm pretty
- 6 optimistic that there are solutions out there that can
- 7 address some of these problems if we roll up our sleeves and
- 8 work on it. With regard to New York there are some things
- 9 that are very different and some things that are not very
- 10 different in New York that I think we need to keep in mind.
- 11 One is the market plays as key a role in New York
- 12 as it does in New England and elsewhere in coordinating
- 13 decisions by private investors which is really important in
- 14 New York because most of our generating assets are held by
- 15 companies that are private.
- So they are relying on the market signals on the
- 17 decisions they make to enter and even more importantly to
- 18 exit the market. Another unique aspect of the New York
- 19 market is that we probably -- I'd have to look but I would
- 20 place a lot of money on the fact that it's the oldest
- 21 portfolio generation in the country. It is dominated by a
- 22 generation of 40-50 years old.
- 23 So these are all generators that are approaching
- 24 or actually at the retirement timeframe and have to make key
- 25 decisions on making investments to keep units in operation

- 1 and so when we start thinking about regulatory uncertainty
- 2 whether it is generated at the state level or at the federal
- 3 level that will undermine a private investor's ability to
- 4 make those decisions efficiently then it is just going to be
- 5 cost increasing and lead to a disorderly transition which is
- 6 I think not what we want.
- 7 So I think a large part of what we are talking
- 8 about here goes back to some of the concepts that we talked
- 9 about in the New England context which is coordinating the
- 10 entry and exit decisions which is really critical in New
- 11 York.
- 12 You heard the City of New York talk about
- 13 re-powering. They have an intense interest in moving away
- 14 from some of the old units that we currently rely on in New
- 15 York City. One of the aspects of New York that you have to
- 16 think about -- I think the CASPAR idea is very applicable to
- 17 New York but one of the challenges of applying something
- 18 like that in New York is that New York is probably the most
- 19 locational and complicated and has more locational concerns
- 20 than any market that we have seen.
- 21 You can't just say okay we are going to retain a
- 22 nuke in western New York and we are going to retire
- 23 something in New York City. And even within New York City
- 24 there are different voltage level systems and different load
- 25 pockets where it matters a whole lot. You can't just build

- 1 something one place in New York City and retire something
- 2 elsewhere.
- 3 So as we develop solutions that attempt to
- 4 coordinate entry and exit we have to think hard about how we
- 5 keep the reliability obligations of the ISO, the resource
- 6 advocacy obligations, the transmission security obligations
- 7 in mind so that we develop solutions that are actually
- 8 practical which may be more difficult in New York.
- 9 And finally I think the carbon pricing isn't the
- 10 easiest thing to think about as a potential solution. I do
- 11 think utilizing RGGI is probably the best approach but
- 12 harder than doing something in one state because it requires
- 13 more agreement across the board.
- 14 But to the extent that the goals -- the
- 15 objectives are really carbon reduction I think you will get
- 16 bigger reductions faster at a lower cost and cause some of
- 17 the interventions -- maybe not all of the interventions to
- 18 be taken care of naturally through the market.
- 19 I think there still are some expressed goals that
- 20 the states have that carbon pricing won't get you there so I
- 21 think it is still incumbent on us to think about how we deal
- 22 with those in a way that's not disruptive to the market.
- MR. QUINN: Thank you, John?
- 24 MR. SHELK: Good afternoon and thanks for the
- 25 opportunity to participate in the Conference. And building

- 1 on what Mr. Jones said the benefits that you have seen in
- 2 the market today that you are talking about in terms of the
- 3 transition that has already occurred, the reduction in
- 4 criteria pollutants, the reduction in carbon emissions,
- 5 putting in new resources and investor risk not customer risk
- 6 -- that's all happened under the current market structure.
- 7 And certainly the State of New York like other
- 8 states have interest in clean energy and new technologies
- 9 and that's all fine and we can discuss those. But what we
- 10 have to keep in mind is that as Commissioner Honorable said
- 11 we are here today after 3 United States Supreme Court
- 12 decisions.
- And the huge decision, the most recent of the 3
- 14 unanimously held last year that states cannot pursue even
- 15 legitimate and through improper regulatory means. And the
- 16 court also said that this Commission is not required to
- 17 accommodate everything a state wants to pursue -- in fact
- 18 just the opposite.
- 19 So the mere fact that we are here today for two
- 20 days with 60 witnesses at about 20 questions, indicates to
- 21 us that the states are in fact, in some instances,
- 22 encroaching on this Commission's jurisdiction and for that
- 23 reason we and many of EPSA's members are parties to
- 24 litigation in New York and Illinois.
- 25 So we can have this discussion but it is

- 1 important to keep in mind that this transition that you are
- 2 referring to in your original question requires all of the
- 3 resources that are on the grid. We don't have a nuclear
- 4 grid or a gas grid or a coal grid, we don't have a separate
- 5 grid for base load or mid peaking, it all has to work
- 6 together.
- 7 And our concern is back to what Commissioner
- 8 Honorable said earlier this has to be done comprehensively
- 9 and it has to be done within the bounds of the law. So one
- 10 of the concepts that has not been talked about yet is what
- 11 should a state do, what should a market do if it doesn't
- 12 like the current status quo?
- And what we haven't talked about is when, if
- 14 ever, is unilateral action allowable -- because that's
- 15 what's happened to date. We are not having a coordinated,
- 16 comprehensive discussion through the ISO in the case of New
- 17 York or the others that were discussed in the next two days
- 18 to bring everybody together first and then discuss how on a
- 19 coordinated basis we would achieve the goals you have
- 20 identified, the transition that's reliable and affordable.
- 21 Instead up until now we have had unilateral
- 22 action which actually makes it harder not easier to do what
- 23 John Reese and the others have said which is have this
- 24 transition in an orderly fashion that recognizes that if you
- 25 want the benefits of markets then you have to keep the

- 1 markets in a well-functioning manner.
- 2 Accommodation of every single thing that is
- 3 brought forward is not the law, it's not good policy and we
- 4 don't think that should be the focus. We should be working
- 5 together to achieve what we have been able to do to date
- 6 which is lower emissions of criteria pollutants, lower
- 7 greenhouse gases, bring on new technologies but do it in a
- 8 way that works through the market rather than work outside
- 9 of the market.
- 10 MR. QUINN: Thank you, Scott?
- 11 MR. WEINER: Just a couple quick points. I want
- 12 to build upon Brad's comments. Number one I like the word
- 13 partnership I'll be very clear about that. I also just on a
- 14 personal level like the word harmonize better than
- 15 accommodate -- it just has a better ring to me. It talks
- 16 about coming together and I want to connect Brad and David's
- 17 comments.
- 18 We are absolutely committed as I talked about as
- 19 Brad mentioned to this partnership to explore. We don't
- 20 know what the outcome is yet and I think there is a good
- 21 starting point that has been presented by the ISO to the
- 22 Brattle's approach and we will take a look at that.
- 23 But I would venture to guess when all is said and
- 24 done wherever we end up it is not going to be a single
- 25 solution. It is going to be a piece part of the mosaic of

- 1 actions and policies that harmonize with each other, RGGI
- 2 being one of them.
- 3 I can, in fact I did with many people in this
- 4 room I did. I was present at the birth of RGGI but when we
- 5 came together we came together to lower carbon, we didn't
- 6 come together to create a market pricing. I'll be happy to
- 7 divulge that it provides very valuable information and it is
- 8 something which is harmonized into our policy framework,
- 9 that's something that will continue.
- 10 So I want to also continue and say Amen to
- 11 partnership and Amen to harmony.
- 12 MR. QUINN: Kathleen?
- MS. BARRON: Coordination, partnership,
- 14 harmonization, those are all things that we should certainly
- 15 do and no doubt are going to result in something that will
- 16 get you some more harmony on this side of the table as well.
- 17 So no question that that's what the goal should be. The
- 18 question is when we don't have that, when we don't have a
- 19 solution at a wholesale level, what are the states to do?
- 20 Are they to step back and ignore their clean
- 21 energy policy goals, ignore the health effects on their
- 22 citizens and ignore what they think is in the best interest
- 23 of their communities and that is what the State of New York
- 24 was facing with respect to the Clean Energy Standard.
- 25 And it is clear markets have delivered

- 1 de-carbonization. They have delivered lower criteria
- 2 pollutants but that is obviously not by design that is just
- 3 by luck. It's a function of gas prices and the load growth.
- 4 So against that backdrop and facing resource
- 5 decisions that were being made on behalf of my company and
- 6 others that saw a lack as Brad said of a pricing for
- 7 existing nuclear to stay in the market made decisions to
- 8 retire, the state stepped in to say that is not a good
- 9 outcome for our consumers. Nuclear is a very low cost
- 10 carbon abatement action and we are going to take advantage
- 11 of that as we look forward towards adding new generation to
- 12 the system and displacing existing emitting generation.
- I mean let's just be honest that's what this
- 14 discussion is about. We have a pretty health reserve margin
- 15 in New York and elsewhere. We have a lot of supply. In
- 16 fact the earlier discussion was focusing on this issue of
- 17 how do we avoid continuing over-supply, that's what we have.
- 18 And what that means is we don't have a
- 19 reliability consideration, we don't have a lack of resource
- 20 adequacy. We have too much on the system right now and we
- 21 may need to have some, you know, we have had illusions to
- 22 the fleet in New York City being close to 70% of it being 50
- 23 years old. We may need to have some of those resources exit
- 24 as we move through this transition.
- 25 But keeping the existing nuclear fleet in the

- 1 market it is not affecting where the market clears, it is
- 2 already in the market and sure if it were to retire that
- 3 would have a tremendous impact on the market but it is not
- 4 changing where the capacity price clears month to month.
- 5 What it's doing is making sure that these assets
- 6 remain available to the state as they move forward with
- 7 their clean energy policy. And taking steps to stop the
- 8 state from doing that are going to serve only to keep prices
- 9 higher in a market where we don't need new resources and to
- 10 what end.
- 11 Why would we do that to consumers? What would
- 12 that be solving to prevent a fair amount of what I consider
- 13 pessimism on the earlier panels about the parade of
- 14 horribles that could come down the road. We are not seeing
- 15 those outcomes now, let's keep working towards this
- 16 harmonization and partnership and collaboration that we have
- 17 been speaking of and try to get that done.
- 18 Let's not try to stop the states from doing the
- 19 things they think they need to do and indeed it was the only
- 20 thing that they could do in the interim.
- 21 MR. QUINN: Do you have a quick follow-up?
- 22 MR. KRESOWIK: Yes very quick. I just want to
- 23 emphasize what Kathleen said. I think in all three of these
- 24 regions including New York ISO, there's no evidence of a
- 25 resource adequacy issue, you know that was one of the

- 1 questions that was asked repeatedly on the earlier panels
- 2 and there is none, there is no resource adequacy issue and
- 3 so I think that's important too.
- 4 MR. QUINN: John?
- 5 MR. REESE: Having sat at the table for New York
- 6 when RGGI was created we talked about markets all the time
- 7 in setting RGGI up with the states of Massachusetts,
- 8 Connecticut, with many states. It was a market solution as
- 9 I recall it.
- 10 But more importantly I think you have pointed out
- 11 a large portion of the generation in New York is mature. If
- 12 I was a little younger I would say it was old. But it is
- 13 mature. And over the time horizons we are talking about we
- 14 are going to see a portion of that generation disappear.
- 15 Whether forced to by other market solutions or
- 16 just by you know reaching, you get to 2030 and we are 12
- 17 years out, 13 years out, some of those assets not ours,
- 18 somebody else's of course may not be around. And we need to
- 19 think about how we replace those assets because when you
- 20 look at the amount of renewables for example that is
- 21 projected to come into New York over the next 12 years that
- 22 doesn't make up a quarter of the assets that are over 50
- 23 years old or 45 years old.
- 24 There's not a good match on the aging out of the
- 25 resources and the projected realistic you know, how long

- 1 does it take to bring renewables into the market. So I
- 2 think it's not something you know, we can wait for a decade
- 3 until we hit a crisis, we need something before that.
- 4 MR. QUINN: Thank you, sorry I think we have
- 5 heard a little bit about carbon pricing and whether it has
- 6 got potential to be a near term manner to harmonize. I
- 7 would like to talk a little bit more about that and maybe
- 8 connect to the conversation we had earlier this morning
- 9 about the difficulty of doing that in ISO New England where
- 10 there are 9 states, 9 different goals that carbon price ends
- 11 up being maybe -- I think we heard the term lowest common
- 12 denominator.
- 13 New York is one state. So I would like to talk
- 14 about whether the fact that New York is one state makes the
- 15 carbon discussion an easier discussion to have and I also
- 16 would like to kind of circle back to something David said
- 17 about RGGI being the place to do that, that clearly turns a
- 18 one state question into a multiple state question and so
- 19 that feels like a complication but I sense that there is
- 20 some desire to avoid creation of seams or the fact that RGGI
- 21 being multi-state actually has some benefits as well as some
- 22 complications, so I'm mostly looking for folks to kind of
- 23 react to kind of that take.
- 24 MR. KRESOWIK: Again I do want to emphasize the
- 25 Regional Greenhouse Gas Initiative is we think the right

- 1 mechanism to price carbon in the 9 state region and even
- 2 beyond if other states want to join.
- I do want to I think with New York in particular
- 4 -- it is possible for a state to price carbon in addition to
- 5 the Regional Greenhouse Gas Initiative. I think
- 6 Massachusetts actually has a proposal to do that right now.
- 7 I am not sure that it is advisable and I think it is
- 8 particularly troubling to imagine the market operator kind
- 9 of proposing to do that.
- 10 The market operator and you know the stakeholder
- 11 price is not a public entity. It is not a public process.
- 12 It is not a set of sovereigns getting together to move
- 13 forward a policy and so I think there is some very big
- 14 unintended consequences that would happen if the market
- 15 operator was the entity in order to move forward a price on
- 16 carbon including undermining that sovereign process by
- 17 driving down RGGI prices and ultimately undermining the
- 18 RGGI program itself.
- 19 So we don't support and think that the market
- 20 operators are the right entity to price carbon. We think it
- 21 should be the sovereign and should be the states.
- 22 MR. QUINN: Thank you. I didn't see the cards go
- 23 up in order so I am going to go with Brad first and then I
- 24 will --
- 25 MR. JONES: Thank you that is not the correct

- 1 order but still. Well thank you so I will follow behind on
- 2 Mark on that point. So the question is, is it easier for
- 3 New York to accomplish this goal through utilizing the
- 4 energy markets and incorporating the price of carbon?
- 5 I think easily the argument could be yes number
- 6 one because the state wants to be the leader in low carbon
- 7 electricity. Our state is very focused on providing a low
- 8 carbon solution so the fact that the state is already in
- 9 that posture wants to be one of the leaders in the nation to
- 10 accomplish that goal helps us to get there.
- 11 Next, being a single state helps us to get there.
- 12 The state is all one so they are all focused on the same
- 13 overall goal. If we were to use RGGI it is hard to be the
- 14 leader when you need to make sure that 6 other people or I
- 15 guess it's 8 other people actually come along at the same
- 16 time or 9 as Mark suggested.
- 17 So it is hard to be the leader so I think the
- 18 state has an advantage there as well. One of the greatest
- 19 advantages though is that the hardest thing to figure -- to
- 20 determine, is what is the cost of carbon that should be set?
- 21 And I am happy to say that our state has already set forth a
- 22 social cost of carbon when they developed the ZEC process.
- 23 And so that was a hurdle that we have already
- 24 overcome. So there are a number of things it puts us at an
- 25 advantage to move forward on this issue and I say creates

- 1 the greatest opportunity to solve this in a way as I like to
- 2 say 9 out of 10 dentists would say the right way to it is
- 3 through the energy market, we have the opportunity to do it.
- 4 MR. QUINN: Kathleen?
- 5 MS. BARRON: I'll just chime in in support of
- 6 what Brad said. I think the issue is not whether a state
- 7 can put a price on carbon, it clearly can do that. It can
- 8 enact a carbon tax but is that going to have the effect that
- 9 the state wants?
- 10 Sure it is going to make its generation run less
- 11 but in an interconnection that we are in right now that
- 12 means that the generation in the states abutting that state
- 13 is going to run more and so to what end would -- you know,
- 14 cause a negative impact on the generation in your state when
- 15 you are not actually achieving your carbon goal.
- 16 So that's the problem that I think any state
- 17 that's looking to do this unilaterally is facing. And the
- 18 challenges that RGGI has had dealing with that leakage issue
- 19 are well known. And you know I hate to sort of put a
- 20 spotlight on this building but I think this is one of the
- 21 few places that could address that question of how to adjust
- 22 within the wholesale market flows back and forth between
- 23 states that choose to price carbon and states that don't?
- 24 And I think that's part of the work that needs to
- 25 happen both through the work that the New York ISO is doing

- 1 and the work that PGI has signaled in their pre-filed
- 2 comments that they are doing and that I think that the New
- 3 England processes are already well along the way of
- 4 examining.
- 5 Whether the states choose that or not is a
- 6 different matter. But putting it in the tariff as the
- 7 Commission has done in California to deal with flows across
- 8 that border is a pre-requisite to a state acting
- 9 unilaterally to price carbon because otherwise it won't
- 10 achieve the goal that it has because plants in the
- 11 neighboring states will just run more.
- MR. OUINN: John?
- 13 MR. REESE: So we do business in EGM, have done
- 14 business in New England, I'm from New York. It's misery in
- 15 New York let me just tell you that. It isn't an easy place
- 16 to do business however I agree with what everybody has said.
- 17 It is -- it will be easier to accomplish this because it is
- 18 a one state ISO.
- 19 When the PSE makes a policy and the ISO has
- 20 reached agreement the market participants will come up with
- 21 solutions to deal with this. We did a study in 1994 as part
- 22 of RGGI what if New York went alone and what were the
- 23 impacts on the market at that point.
- I think it can be accomplished but I think
- 25 Kathleen points out the issue will become seams issues and

- 1 how do you deal with those and that's a role for you
- 2 clearly.
- 3 MR. QUINN: Scott -- alright then Jim I think you
- 4 are next.
- 5 MR. HOLODAK: Yeah just a couple of things on
- 6 carbon pricing as well as on RGGI. I tend to agree with
- 7 Kathleen that the emission reductions that have occurred so
- 8 far haven't necessarily been because of RGGI. And I won't
- 9 say they have been in spite of RGGI but it has helped but it
- 10 has mostly been about the shale gas and the huge reduction
- 11 in natural gas prices as well as the economy and the lower
- 12 generation that was required I think.
- 13 In order for RGGI to really drive it and a single
- 14 state as everyone is saying should hope to be easier but I'm
- 15 not sure New York is really easy with anything. I'd like to
- 16 flip it on its head a bit and suggest that rather than
- 17 taxing carbon we ought to be able to find environmental
- 18 attributes that we are willing to pay for.
- 19 So as opposed to taxing, collecting funds, you
- 20 know, redistributing back to electricity customers or using
- 21 them for general funds or whatever it doesn't necessarily
- 22 suit the need to solve the issue unless you price that tax
- 23 high enough or the RGGI priced high enough that it will
- 24 actually move people to close plants and reinvest in
- 25 renewables.

- I don't know that we necessarily have seen that.
- 2 If we had then you wouldn't need RFP's and mandated PPA's
- 3 for off-shore or on-shore, solar or anything else so rather
- 4 than tax and spend I would suggest an alternative would be
- 5 to price a positive attribute and figure out an ancillary
- 6 type market in the wholesale markets that you could
- 7 accomplish that growth and drive behavior that way. It's
- 8 just two sides to the same coin I guess.
- 9 MR. PATTON: Okay so at a risk of undercutting my
- 10 earlier comment that RGGI is the preferred mechanism I do
- 11 agree with you that it is easier to get consensus in a one
- 12 state context and I actually don't think the seam issue is
- 13 that big of a deal because you can establish a carbon
- 14 content value of imports coming in and price it so that you
- 15 don't favor generation outside versus generation inside.
- 16 So that part actually may even be easier to do of
- 17 one state context then in the RGGI leaking context although
- 18 I think you tamper in RGGI too. The one advantage I think
- 19 of RGGI is a couple of things.
- 20 One is establishing the value of carbon I think
- 21 the cap and trade system establishes a value rather than
- 22 having the social value of carbon just be sort of plucked.
- 23 And if you look at the underlying analysis there's -- that
- 24 number can end up anywhere depending on any number of the
- 25 assumptions that go into to calculating it so I think one of

- 1 the challenges you have -- again back to you have got assets
- 2 in the hands of private investors who have to have trust and
- 3 have -- the market has to be credible.
- 4 You know for decades down the road for the kinds
- 5 of decisions they are making so that carbon value or
- 6 whatever you set up to price carbon there has to be a degree
- 7 of credibility to it and you have to trust that 5 years down
- 8 the road a new administration is not going to come in and
- 9 say carbon is worth \$5.00 for instance.
- 10 And so the RGGI market I think also provides a
- 11 little more credibility to the price of carbon that then
- 12 flows through the electricity markets as well but it's no
- 13 doubt more difficult a solution.
- 14 MR. QUINN: Thanks. So John then we will do Brad
- 15 and Mark.
- MR. SHELK: This has been a helpful discussion
- 17 because the prior comments illustrate the dilemma we faced
- 18 with the status quo which is why in the filing that we made
- 19 at the beginning of the year within this regard we said that
- 20 the status quo was not acceptable and there's an existential
- 21 threat and here's way.
- 22 It's based on everything we have heard from the
- 23 prior comments. Mr. Jones said the State of New York put a
- 24 price on carbon. The State of New York put a price on
- 25 carbon for three power plants that equates to \$45.00 a ton

- 1 or thereabouts. Everybody else in the state now sees to the
- 2 RGGI process and Dr. Patton and Mr. Jones and correct me if
- 3 I am wrong, a price of only \$3.00 a ton.
- 4 And everything that we have heard about climate
- 5 science is that a ton of carbon avoided is a ton of carbon
- 6 avoided whether it is downstate New York, upstate New York,
- 7 New England, halfway around the world.
- 8 So this is the problem we have if this Commission
- 9 acts in these areas you are bound by the law that says
- 10 things have to be not only just and reasonable but not
- 11 unduly discriminatory preferential. So we have a system
- 12 today where extensively for carbon reasons a price was put
- 13 on carbon, but not just a little bit more, dramatically
- 14 more.
- 15 So again Mr. Jones will correct me. The price in
- 16 New York today is probably \$30 to \$35 a megawatt hour. So
- 17 when the ZEC program takes affect those three units get a
- 18 50% premium and the people who pay for it in the State of
- 19 New York include people who consume 100% renewable energy
- 20 down state.
- 21 So if you buy a 100% renewable product you still
- 22 have to pay for this. So if we are going to put a price on
- 23 carbon and price attributes which is exactly what we have
- 24 all said should happen it needs to happen in a
- 25 non-discriminatory basis and I agree with the earlier

- 1 comments to find the attributes. If it is carbon, if it is
- 2 operational, flexibility -- whatever it happens to be but I
- 3 think what we have heard this morning and we have heard on
- 4 this panel and we already know ourselves is it has to be
- 5 done equally for everybody or the price signals aren't there
- 6 to do this in a cost effective manner and it becomes this
- 7 dust fire where you are going to drive people out and not
- 8 set the signals for everybody.
- 9 And that's what is not sustainable and those are
- 10 the facts that we need to keep in mind as we evaluate what
- 11 to do going forward.
- 12 MR. QUINN: Alright Kathy you have a quick on?
- 13 MS. BARRON: Yes it's quick because John is my
- 14 friend I'll be nice to him. Just to verify the record there
- 15 is a price on carbon for renewables in the State of New
- 16 York. There was a procurement that was held recently that
- 17 resulted in a REC price of over \$24.00 a megawatt hour, the
- 18 ZEC is \$17.00 a megawatt hour.
- 19 It's not just the nuclear plants that are
- 20 receiving a signal to stay in the market because of their
- 21 carbon abatement value -- it's all the renewables as well.
- 22 That is part of a clean energy program that the state has
- 23 enacted as I said earlier because it believes that that is
- 24 the best outcome for its consumers.
- 25 The question here is could we do so on a more

- 1 generic basis, technology neutral not fuel specific, that is
- 2 what Brad is working on, that is what we would like to keep
- 3 working on.
- 4 But let's just be clear about what the facts are
- 5 it's not just the three upstate plants that get a price
- 6 signal for being low carbon.
- 7 MR. QUINN: I'll go with Brad and I'll get our
- 8 friends for the state and see where we are from there.
- 9 MR. JONES: I'm glad Kathleen poked John so that
- 10 I don't have to so she covered that. I will say that I
- 11 agree with David Patton just a few moments ago and it's good
- 12 because we are sitting right here together. But he
- 13 specifically said that we can't manage the leakage issue at
- 14 the border, that's not a concern.
- 15 There are multiple ways that we can do that so we
- 16 have not shown a concern for that. And to respond to Jim
- 17 earlier who was concerned about a tax and spend approach.
- 18 What we are discussing is not a tax and spend approach, it
- 19 is an approach by which we charge generators that are
- 20 producing carbon and we return those revenues equitably back
- 21 to customers.
- 22 So I just wanted to clear up those two points,
- 23 thank you.
- MR. QUINN: Thank you, Janet?
- 25 MS. JOSEPH: I just want to get back to a single

- 1 state system you know to price carbon. I think we are
- 2 asking the wrong question right? I think that the question
- 3 needs to be what will the impact be from the mechanism?
- 4 So when we look at our dialogue with ISO we will
- 5 be approaching it from that standpoint but making a
- 6 pre-determination that pricing carbon is the way to go is
- 7 sort of ahead of where we are at. We want to look at what
- 8 are the instruments and the mechanisms that can achieve
- 9 impact.
- 10 So we have to look at things like leakage, we
- 11 have to look at things like what will the impact on RGGI be
- 12 as we assess this. So I guess I would ask the participants
- 13 not to get sucked into the mechanistically can we do it --
- 14 mechanistically should we use the wholesale markets to do
- 15 X,Y,Z.
- We have to keep bringing it back to those impacts
- 17 that we talked about earlier -- that's ultimately what we
- 18 want to achieve.
- MR. QUINN: Scott did you have anything on top of
- 20 that?
- 21 MR. WEINER: Just one point to respond to
- 22 something John said. The Commission in adopting the CS
- 23 program included a provision that allows a community that is
- 24 in fact 100% renewable from new sources to apply to be
- 25 relieved of the ZEC complication.

- 1 That has not yet been implemented but we are
- 2 waiting and expecting some application soon.
- 3 MR. QUINN: Maybe I'll ask a follow-up of your
- 4 kind of re-framing of the question about you know not
- 5 whether we can but whether we should and what would the
- 6 impacts be. I certainly didn't mean to you know, solicit a
- 7 filing for carbon price.
- 8 But when you look at those impacts, is one of the
- 9 impacts you look at and maybe this is a bar question is one
- 10 of the impacts you look at not just the impact on cost and
- 11 how those costs are allocated but also how congruent that
- 12 those impacts are if they are brought into the wholesale
- 13 markets versus staying outside of the market, is that one of
- 14 the considerations that you have when you think about
- 15 impacts?
- MS. JOSEPH: Yes.
- 17 MR. QUINN: Alright thanks, so Mark and John and
- 18 then we will let the Commissioners jump in here.
- MR. KRESOWIK: I think one of the perspectives
- 20 that has been lost and that I appreciate here is actually
- 21 the consumer perspective here perhaps because the previous
- 22 Respondent panel and this panel are mostly generators which
- 23 I think the consumer impacts were highlighted in terms of
- 24 putting a price on carbon in a predominantly gas system may
- 25 not actually be two significant carbon pollution reductions.

- 1 Secondarily you talk about returning the revenues
- 2 generated to consumers may or may not be the best policy for
- 3 consumers. Regional Greenhouse Gas Initiatives in the
- 4 states have voted most of the revenue generated to energy
- 5 efficiency predominantly for low income folks or low income
- 6 assistance, a variety of mechanisms and I think it is very
- 7 important to highlight the benefits of those mechanisms that
- 8 would be lost if the market operators in many cases were the
- 9 ones who moved this policy forward.
- 10 And that's one of the reasons why we support the
- 11 Regional Greenhouse Gas Initiative and been opposed to the
- 12 market operators controlling carbon prices because of the
- 13 impact on consumers. So if you get to just and reasonable
- 14 rates I think it is very important to remember, you know,
- 15 what are the impacts on the ultimate people who are paying
- 16 for this which I think has gotten lost in these
- 17 conversations?
- 18 MR. QUINN: John?
- 19 MR. REESE: I will try to -- first just to be
- 20 clear one of the reasons why you know I was urging action
- 21 and why I think FERC really needs to take action is we have
- 22 three prices for carbon in New York. We have a price for
- 23 two of the three oldest nuclear facilities in the nation
- 24 which is around \$40.00.
- 25 We have a price for brand new competitive based

- on an RFP renewables which is \$24.00 and then we have the
- 2 price for my mature units and brand new \$5,900 heat ray
- 3 combined cycles which was \$2.70.
- 4 There's a disparity there and there's a disparity
- 5 in the market without modification can't solve. To go to
- 6 consumers just to be clear, 7 years ago commodity -- the
- 7 wholesale market price was about 40% of the New York City
- 8 customer's bill. It's 28% of the customer's bill.
- 9 The part that has FERC oversight that the markets
- 10 are responding to for a variety of reasons granted has gone
- 11 down. We are -- the remainder is for legitimate
- 12 transmission and distribution and taxes and the fees that
- 13 are going to these programs and services.
- 14 Integrating those fees -- integrating our
- 15 objectives into the marketplace is going to bring us lower
- 16 prices. I mean we know that.
- 17 MR. QUINN: Thank you, Chairman LaFleur and
- 18 Commissioner Honorable?
- 19 CHAIRMAN LA FLEUR: Thank you Arnie. This has
- 20 been a really interesting conversation. I'm still stuck a
- 21 little bit where I was first thing in the morning. To the
- 22 extent that we want the New York ISO competitive markets to
- 23 attract investment or send exit signals for non-favored
- 24 resources is it capable of doing that job in the short run?
- 25 I know we are going to have a long collaborative process and

- 1 sing Kumbaya but I'm worried about June 1 and July 1 and
- 2 what's going to happen now.
- 3 I know you filed something in January. We lost
- 4 the quorum February 4th so here we are. I guess my question
- 5 is if when the state has chosen to make sure certain
- 6 existing resources stay in the market and is doing a lot of
- 7 other things to make sure other resources that the state
- 8 wants to get built and I saw in Jim Holodak's you know,
- 9 testimony National Grid is willing to come in and build
- 10 renewables but it doesn't want to build anything else.
- 11 Well I think a lot of people are willing to come
- 12 in and build renewables with the system. My concern is when
- 13 I hear you talk about re-powering to me re-powering sounds
- 14 like gas and if I was advising a Board of Directors to put
- 15 capital down into this market to build a gas plant given all
- 16 the other currents of monies that are going to other things,
- 17 I'm just wondering if I would and that makes me wonder are
- 18 we going to get into a thing where either we now have to
- 19 subsidize gas which in this case why not just re-regulate
- 20 and be honest, be a one state ISO and run a great energy
- 21 market out of your beautiful control center.
- 22 Or are we going to have RMR's where we keep
- 23 things on and then we have more and more RMR's? I'm just
- 24 concerned, I see -- some people said in their testimony,
- 25 "Don't worry none of this is going to affect market prices."

- 1 Then we heard John Reese say, "It already has." Do we want
- 2 to attract investment? Do we need it? I know there are
- 3 lands of plans upstate Kathleen, there have been lots of
- 4 plans upstate forever. There's wind, there's nuclear,
- 5 there's old coal. Downstate where the people live there's
- 6 not lots of plants.
- 7 And I know people live upstate I'm sorry I used
- 8 to go there all the time, but where most of the people live.
- 9 So I mean are we trying to attract investment or we are just
- 10 going to pay people to come in because I'm just worried
- 11 about all the things that we are doing in this market. Okay
- 12 that's my silique.
- 13 MR. QUINN: David do you want to go first?
- 14 MR. PATTON: Well obviously I have a fair amount
- 15 of sympathy for what you just said. Yeah I think what I
- 16 worry about is the answer to that is now in the short-term.
- 17 I mean I think we have to keep in mind that any dollar an
- 18 investor spends is going to be based on an expected set of
- 19 revenues over many years and if there's no solution in sight
- 20 at this moment and you are asking me to money in as an
- 21 investor at this moment -- I don't know why they would.
- 22 So that's the concern and that's the urgency and
- 23 I think what I'm afraid we are going to get to is a very
- 24 competitive market for rents and subsidies rather than a
- 25 competitive market for generating assets and energy and

- 1 ancillary services.
- 2 So I think we have to get our hands around this
- 3 and figure out which direction we are going relatively
- 4 quickly.
- 5 MR. QUINN: Brad?
- 6 MR. JONES: Thank you. I agree with what David
- 7 has said. In the short-term this is not a short-term
- 8 process, this is something that will take some time to get
- 9 to. Just as we discussed our partnership working in that
- 10 direction it will take probably a number of years to find a
- 11 solution.
- 12 In the meantime my hope is that the state has
- 13 taken some actions to preserve some generation in a way that
- 14 will carry them into that future market if we decide to go
- 15 into that market future.
- 16 You talked about investment ultimately -- if we
- 17 do crack this issue and we are able to figure it out we have
- 18 the real possibility of driving the type of investment we
- 19 want so quite a bit of discussion from the City of New York
- 20 about re-powering generation.
- 21 We will actually be sending signals to generation
- 22 in the New York City area because if you can avoid a higher
- 23 carbon output by putting in a more efficient facility that
- 24 can be done.
- 25 CHAIRMAN LA FLEUR: I completely agree. But I

- 1 didn't hear anyone saying that filing is coming any time
- 2 soon.
- 3 MR. JONES: It's not coming any time soon. It
- 4 will take some time to get there and it is a process as you
- 5 know working through our market participants takes a long
- 6 time to get there and working with the state to get them
- 7 comfortable with this approach will take a while.
- 8 And the entire process I believe at a minimum
- 9 would be three years.
- 10 MR. QUINN: I think Jim you are next.
- 11 MR. HOLODAK: In my testimony we did offer a
- 12 solution that National Grid would be willing to build large
- 13 scale renewables under cost of service regulation. We would
- 14 prefer that the wholesale markets can figure it out, that's
- 15 our absolute preference.
- 16 Secondly, in absence of that we do like the
- 17 NYSERDA model that procures REC's and ZEC's on behalf of the
- 18 states. One of the questions was whether or not National
- 19 Grid or each of the panelists up here collects subsidies and
- 20 the answer for us would be yes but we pass them right on
- 21 through to NYSERDA who then distributes them back to the
- 22 other generators.
- 23 So there's nothing in it for us. What we are
- 24 trying to do is make sure that to get where we need to get
- 25 to we are always mindful of the cost and the impacts on our

```
1 customers. So in the absence of working markets, our
```

- 2 proposal on cost of service regulation is just that.
- We think that it is a cheaper way to do it,
- 4 potentially more cost-effective way to do it because of our
- 5 access to capital markets, because of the fact that after a
- 6 PPA expires those renewable attributes go back to the
- 7 generator and in New York those contracts for 10 years.
- 8 Now we may be extending them to 20 -- we had
- 9 extended them to 20 years. So customers pay for the
- 10 generator to be installed, recover its capital costs and
- 11 then at the end of the term we lose all of those economic
- 12 benefits of the renewable credits.
- 13 Utility ownership would solve that. I would say
- 14 we build it or we have a developer build it through a
- 15 competitive process, come up with as cheap a price as you
- 16 can, flip it to the utility to own and operate it under cost
- 17 of service and then we maintain those valuable environmental
- 18 attributes post when the normal contract would have ended.
- 19 CHAIRMAN LA FLEUR: I know you don't want to but
- 20 could you also finance gas cheaper than someone coming into
- 21 the market because of your balance sheet -- no? I mean
- 22 that's just like -- now it's everything old is new again.
- 23 MR. HOLODAK: In fact in New England we worked
- 24 with Ever Source to potentially do such a thing.
- 25 CHAIRMAN LA FLEUR: I'm sorry I didn't mean

- 1 pipeline, I meant a gas unit. But if you want to build a
- 2 pipeline I'm not your problem, not that I'm pre-judging
- 3 anything.
- 4 MR. HOLODAK: Oil and gas needs to balance all of
- 5 the renewables I guess. No we would consider that if that's
- 6 what it took.
- 7 MR. QUINN: So I think I will just run down the
- 8 line so we will do Mark, John, John.
- 9 MR. KRESOWIK: Great. To speak to downstate for
- 10 a moment, since the Long Island Power Authority isn't here,
- 11 nor PSEG on this particular panel. I do want to highlight
- 12 their recent integrated resource plan where they went and
- 13 found re-powering is not the cheapest option.
- 14 Renewables and demand response energy efficiency
- 15 are in fact the right things to keep doing. So the
- 16 assumption that re-powerings are necessary and advisable is
- 17 perhaps a little premature which gets back to my broader
- 18 point that I think a lot of this that there isn't sufficient
- 19 evidence yet of a problem.
- 20 And I think to the extent there is in terms of
- 21 you know, resource adequacy problem if there are other
- 22 reliability issues I think that goes to better defining what
- 23 reliability services are actually necessary downstate right.
- 24 So there is resource adequacy -- I want to be
- 25 very clear that base load is not a reliability attribute

- 1 which I hear get tossed around, it is simply a definition of
- 2 capacity factor. Black Star Service is a reliability
- 3 attribute. Reactive power -- go to reactive power is a
- 4 reliability attribute.
- 5 So I think it is better that we better define
- 6 those reliability attributes, create markets to deliver
- 7 those reliability attributes before assuming you know that
- 8 there is a resource adequacy or redefining capacity in some
- 9 way so I just wanted to highlight those things.
- 10 MR. QUINN: John?
- 11 MR. REESE: So I started the panel by talking
- 12 about urgency. You know we are in city generators, it is
- 13 where the constraint is, it is where the oldest fleet is.
- 14 You know Jim if you beg my pardon but if you want to do cost
- 15 of service, we can do cost of service. I just change my
- 16 investors. I can get the investors that want to provide
- 17 that kind of investment for that duration for you know a 40
- 18 year recovery.
- 19 We moved away from that market -- from that
- 20 construct for a reason. One of the reasons was because you
- 21 couldn't site generation in New York City where you need it
- 22 because when you moved into a fully regulated market it
- 23 becomes more political, it becomes more difficult to do a
- 24 lot of things. Otherwise we would have a lot more
- 25 transmission.

- 1 So there is urgency and the model works, and I
- 2 think the model is the solution, but we need action. I'm
- 3 going to have to come and ask for investment to meet
- 4 environmental concerns over the next decade. It takes me
- 5 between 2 and 3 years to permit a project in New York City.
- 6 You know look if you can have something in place
- 7 that works 24 months from now -- oh that can work absent
- 8 something catastrophic happening, that could work. But it
- 9 can't be 5 years from now. I need to make those investment
- 10 decisions you know in the next 5 years, all of the
- 11 portfolios will, because it is going to take you 5 years.
- 12 MR. SHELK: I would underscore what John Reese
- 13 said about urgency. Every time we have done a filing we try
- 14 to think of a new word, beyond urgency, but to be honest as
- 15 you all know we have been using that word for 4 years now.
- 16 We originally were joined by the Nuclear Energy Institute
- 17 and the Edison Electric Institute and the natural gas
- 18 industry and we came to you on a fuel neutral basis and
- 19 others decided to break that and go on a fuel specific
- 20 basis.
- 21 My concern is exactly what the acting Chairman
- 22 said and on this I'll make it clear for future reliability
- 23 of an old person like me, this is my own personal view. But
- 24 I have been in this position 12 years now. It has been a
- 25 privilege to represent this industry, it is every day.

- I have never in 12 years had the degree of
- 2 inquiry and concern on a nearly daily basis the last 6 to 12
- 3 months that I have had from investors, from analysts on Wall
- 4 Street, from the Trade Press, from members and non-members.
- 5 And what I fear is exactly the fear that posed your question
- 6 which is we are going to be back here sadly if this comes to
- 7 pass, but it is the default path we are on as we speak as of
- 8 today, absent action to the contrary.
- 9 We are going to get to the one place that this
- 10 very table, mention was made earlier of that Conference in
- 11 September of 2013. There was a lot of disagreement.
- 12 Capacity markets always spawn disagreement. As I recall
- 13 correctly that last panel which was thought leaders, many of
- 14 whom we will hear from tomorrow, the one area of agreement
- 15 is exactly the place that we are headed to that everyone
- 16 said 4 years ago don't go there, which was tranches.
- 17 Let's pick "X" amount of nuclear, "X" amount of
- 18 coal, "X" amount of gas. Now it is worse, now we are not
- 19 just picking fuels, we are picking specific units that would
- 20 otherwise have exited so there goes the road with your
- 21 markets.
- 22 So that's the problem the one thing we said don't
- 23 do is the tranches and I said something on the phone to
- 24 somebody the other day and there was gasping on the phone.
- 25 I said but I meant it seriously. We are going to have to

- 1 make a filing or go to state legislatures for flex --
- 2 flexible energy credits.
- You can't get to your transition point, you can't
- 4 get to a point with all the renewables which are great and
- 5 we have members doing it every day and not compensate the
- 6 people who are providing the ramping and the other services
- 7 that are different than how plants operate today. So Heaven
- 8 help us.
- 9 And the thing that hasn't been said needs to be
- 10 said is this may have started in New York last year on
- 11 August 1st but in short order it was adopted in my home
- 12 state of Illinois. And as everybody knows it is now being
- 13 actively considered in Ohio and Pennsylvania and New Jersey
- 14 and Connecticut.
- 15 So this isn't just a threat to the market in New
- 16 York or a threat to New England, this is a threat to the
- 17 very thing that so many people for decades spent incredible
- 18 service in this building to make happen. I hate to say it
- 19 is on the precipice of falling over unless there is some
- 20 concrete plan with specific dates and deadlines.
- 21 And I shuddered when I heard Brad -- not his
- 22 fault, 3 years. 3 more years we will be at the discussion I
- 23 hate to say it of what kind of contract, what kind of out of
- 24 market mechanism will everybody else have to receive to
- 25 literally keep the lights on, and I hope that's not true.

- 1 But after spending all of this time on these last dozen
- 2 years I'd be remiss if I wasn't that candid about where I
- 3 think we are today.
- 4 MR. QUINN: Thanks, Susanne?
- 5 MS. DES ROCHES: So I wanted to go back to an
- 6 earlier question from the Commissioner around sending a
- 7 signal on the re-powering side to you know, using natural
- 8 gas, not using natural gas. And first let me say I'm
- 9 thrilled that there is this much attention on re-powering
- 10 needs of New York City so I'm glad to have brought it up
- 11 earlier.
- 12 But you know from our perspective we know we are
- 13 going to need both and I think that John just talked to --
- 14 we are going to need fast ramping, efficient technologies to
- 15 balance out what we project as potentially about a 70%
- 16 renewable -- large scale renewable portfolio on top of many,
- 17 many gigawatts of solar distributed generation.
- 18 So when we mapped out New York City's 80 by 50
- 19 plan and yes it was transportation buildings, the energy
- 20 sector was rolled into those calculations -- we came out
- 21 with it's hard to get to 70% renewable plus the distributed
- 22 generation solar goals.
- 23 So we know that we are going to need to balance
- 24 that with these fast ramping technologies so that completes
- 25 the picture and that is a balance. So just back to your

- 1 question you know, yes at the moment that is a natural gas
- 2 resource. In 30 years will that be a natural gas resource
- 3 -- we don't know but we anticipate needing both.
- 4 CHAIRMAN LA FLEUR: Well I agree with everything
- 5 that has been said about ancillary services and ramping and
- 6 so forth but -- and I also don't get out of bed and want to
- 7 re-regulate. I lived through the transition also but I want
- 8 to make sure that if we run a capacity market it is a real
- 9 market with enough in it, I'll stop there.
- 10 COMMISSIONER HONORABLE: I'll bet that some of
- 11 you have been reading my notes because one by one you are
- 12 leading to where I want to head next. Where do we go from
- 13 here? Because you all have very well laid bare the urgency
- 14 of where things stand today, where we need to head from
- 15 here.
- And I wanted to echo the comments I made to the
- 17 New York State colleagues -- keep working on your effort I
- 18 applaud your innovation and your willingness to try
- 19 something different to see if that will accomplish all of
- 20 the objectives that you have enumerated.
- 21 I've also heard today really a chicken and egg
- 22 sort of issue when I'm asking you what do you see coming
- 23 next when you leave here today. And I think John said we
- 24 have got to start working tomorrow or maybe it was Scott
- 25 that said tomorrow we are going to start working.

- 1 What does that look like for you because I have
- 2 heard a number of things here today and filed in your
- 3 pre-filed comments? I have heard from some of you, FERC we
- 4 like you, but leave us alone.
- 5 I have heard from others of you, FERC we need
- 6 guidance from you. Kathleen teed up in her comments maybe
- 7 we need regional tech conferences. You know we don't mind
- 8 taking the show on the road. If you all will open the door
- 9 and let us in and put a little kiddie table over to the side
- 10 somewhere for us.
- 11 CHAIRMAN LA FLEUR: I need colleagues before I
- 12 could --
- 13 COMMISSIONER HONORABLE: That's true, we better
- 14 do it quick then, right? And then I've heard from some of
- 15 you that things are fine we don't need to do anything. What
- 16 is next? Because we are creating a record here which will
- 17 aid us in shaping policy that will support you, not erode or
- 18 take away from or undercut.
- 19 We need some clarity from you about what you
- 20 believe needs to happen next.
- 21 MS. BARRON: Thank you for that question and as
- 22 much as I don't fondly recall the road show tech conferences
- 23 we did with a number of many other initiatives here I do
- 24 think that a continuing dialogue is essential.
- 25 Try to do this through paper and when everything

- 1 is ex parte is very, very difficult and there are others in
- 2 the room who have described this as an exceedingly complex
- 3 problem. This being how do we harmonize the state policy
- 4 with the wholesale markets. And New England should be
- 5 commended for the work that they initiated last summer
- 6 through NESCOE to have a dialogue and I know you have sent
- 7 staff there but that is not the same thing as you and your
- 8 staff at the table talking with people about what to do
- 9 next.
- 10 And that if it happens I think John Reese
- 11 signaled you know 24 months as a bogie. Brad was at 36 --
- 12 we have some time to talk about where we go, not an
- 13 unlimited amount of time but as Brad said at least in the
- 14 case of New York I mean his comments represent a signal that
- 15 taking steps to at least keep some of the existing stations
- 16 -- the ones that we know we are going to need to
- 17 de-carbonize in the market is something, that's something
- 18 that they have done.
- And the question is what more do we do? How do
- 20 we facilitate this transition over time? As I said I think
- 21 that you need to stay involved with that. But I do think it
- 22 is important you know the suggestion that this problem that
- 23 we are trying to solve is just about the nuclear programs --
- 24 it's a very, very small part of what we are dealing with
- 25 right now.

- John paints a picture where this sort of is
- 2 contagious across the country. I don't know, no one in this
- 3 room knows whether that will happen but we have other clean
- 4 energy goals that are represented through all kinds of
- 5 programs including plenty of them that are unit specific.
- 6 I can think about off-shore wind programs for
- 7 example that are looking for a specific type of asset to
- 8 come in because the state feels like it is of some value
- 9 given other considerations.
- 10 So we have a lot of things in front of us and the
- 11 question is what should we do in the meantime? Should we
- 12 take action on the one complaint you have pending which is
- 13 only targeting the least cost carbon abatement solution or
- 14 should we take a step back and try to figure out if there is
- 15 a better solution. That is what I was trying to communicate
- 16 with the comments.
- 17 MR. QUINN: Mark then John Reese and David.
- 18 MR. KRESOWIK: Thank you for your great question.
- 19 I would say limit the application of the minimum offer price
- 20 rule to only situations that directly violate the Federal
- 21 Power Act and secondly to better define the reliability
- 22 attributes and services that need to be delivered to
- 23 maintain an affordable, reliable electric system and ensure
- 24 that the market operators have markets set up to deliver
- 25 those reliability attributes.

- 1 Some of the ones that were mentioned a moment ago
- 2 including primary frequency response, fast ramping
- 3 capability you know -- be very, very specific about what
- 4 those reliability attributes are.
- 5 As I said earlier and I'll repeat again base load
- 6 is not a reliability attribute.
- 7 MR. QUINN: John Reese?
- 8 MR. REESE: So sitting before you is a complaint
- 9 and you know 24 months is fine but as soon as you have a
- 10 quorum which I would hope is before 24 months addressing
- 11 that and addressing the issue immediately.
- 12 That 24 months is great to work out a problem --
- 13 our real problem is immediate.
- 14 MR. QUINN: David?
- 15 MR. PATTON: So I think one thing I have become
- 16 convinced of is the harder the problem is the less
- 17 confidence you should have that the stakeholder process can
- 18 negotiate its way to a solution without any guidance or time
- 19 parameters.
- 20 So I probably would disagree with some of the
- 21 panelists here. I think it would be really helpful to at a
- 22 minimum establish some principles, articulate what the
- 23 problem is that you want to see solved and establish some
- 24 economic principles so that when stakeholders are
- 25 negotiating they are negotiating within a space that they

- 1 might come up with a solution that's going to be helpful
- 2 and going to achieve the economic objectives.
- I think we have been maybe the staunchest
- 4 supporter of MOPR but to put that in context it was designed
- 5 from day 1 as an anti-manipulation provision for buyer side
- 6 mitigation provision and so the whole logic behind MOPR is
- 7 it is supposed to deter the activity so that it doesn't
- 8 happen and therefore the market is protected, the supply
- 9 doesn't enter.
- 10 It's a really lousy tool to apply to situations
- 11 where actions are being taken that are being taken for
- 12 reasons entirely other than manipulation or market power
- 13 abuse and so you end up with the supply not being deterred,
- 14 it actually enters.
- 15 And if you -- I may have been too charitable but
- in my comments if you read my economic principles I'm not
- 17 sure the MOPR satisfies any of them when applied to
- 18 renewable and subsidies and other state actions.
- 19 So that's where the provision that we have been
- 20 working on with New England actually is very promising
- 21 because it provides -- it doesn't dismantle the MOPR and its
- 22 application to those investments that should apply to but it
- 23 provides a way out to address the unintended consequences of
- 24 MOPR for all the other investments that it would apply to.
- 25 And I think frankly you know New York ought to be

- 1 looking at that in tandem with the carbon pricing. But I
- 2 think you know you have heard me say this in filing many
- 3 times. I think it would be really helpful for the
- 4 Commission to establish a time frame and some principles to
- 5 help guide the stakeholder process in trying to deal with
- 6 this.
- 7 MR. QUINN: Alright so I think we probably need
- 8 to move on.
- 9 MR. KRESOWIK: Sorry I want to disagree
- 10 respectfully with Dr. Patton's assessment that the proposal
- 11 in ISO New England does not dismantle the MOPR. I believe
- 12 it does remove the renewables exemption from the MOPR which
- 13 I think is important to highlight.
- 14 MR. QUINN: So with that we are going to move on
- 15 to the third session. Thank your panelists this has been a
- 16 great conversation, we very much appreciate all of your
- 17 comments.
- 18 SESSION III
- 19 Panel 1
- 20 MR. QUINN: Alright so we're going to
- 21 get started. I appreciate for all of you who have been here
- 22 all day our lack of breaks has probably been not ideal. But
- 23 nonetheless we are going to start the third session and our
- 24 first panel.
- 25 We appreciate the panelist's patience and waiting

- 1 to get started. I hope this doesn't feel a little bit too
- 2 much like Groundhog Day for you all. We have a threat of
- 3 someone singing if people don't sit down.
- 4 Alright I'm bringing Mark to all of our meetings
- 5 from now on. And that's the nice version. So again thank
- 6 you to the panelists. I very much appreciate your
- 7 willingness to participate. This is our third session
- 8 focused on the PJM market. Our first panel of that session
- 9 will be with representatives from the PJM states.
- 10 I'm pleased to welcome Robert Erwin the General
- 11 Counsel at the Maryland Public Service Commission.
- 12 President Richard Mroz of the New Jersey BPU, Vice Chairman
- 13 Andrew Place of the Pennsylvania PUC and Brien Sheahan the
- 14 Chairman and Chief Executive Office of the Illinois Commerce
- 15 Commission.
- 16 So we are going to follow again the same process
- 17 that we followed for the two earlier sessions. Our first
- 18 panel with our state representatives who will then ask to
- 19 sit on the side for our second panel with a broader
- 20 stakeholder group -- like the earlier sessions I think we
- 21 would like to start out with kind of a broad discussion
- 22 about what the state's expectations are for the role that
- 23 wholesale markets play broadly in pursuit of state goals
- 24 generally but also specifically in the pursuit of the goals
- 25 related to specific resources, resource types, resource

- 1 attributes.
- 2 I think for again reading the pre-conference
- 3 statements for many of the other regions for New York and
- 4 New England there might have been a sense that I think the
- 5 conversation didn't bear this out but maybe that there
- 6 wasn't an expectation that the markets would get new
- 7 resources but rather just organized exit.
- 8 I don't think that's exactly how our
- 9 conversations went about that question and so for PJM I read
- 10 the pre-statement or the pre-Conference statements as
- 11 potentially needing both a new set of resources as well as
- 12 state actions bring specific resource types into the market.

- 14 They need to also have orderly exit. So we will
- 15 start out again like we have the other sessions. What your
- 16 views are on the role of PJM markets and in particular what
- 17 role you think PJM has in ensuring resource adequacy and
- 18 identifying the set of resources and the composition of
- 19 those resources on a long-term basis.
- 20 MR. ERWIN: Thank you Arnie. First of all let me
- 21 thank the Commission and Chairman LaFleur and Commissioner
- 22 Honorable for permitting Maryland -- I know there were a lot
- 23 of people that would have rather been here than Maryland but
- 24 we are pleased to participate.
- 25 I want to apologize for my Commissioner's that

- 1 one of them isn't sitting here. It wasn't for lack of
- 2 interest they are in a proceeding all day today and all day
- 3 tomorrow. So that took precedence.
- 4 The written statement that we filed was reviewed
- 5 and approved by the Commissioners so that is the Commission
- 6 statement. What I say here today are my own views and are
- 7 not necessarily the views of the Commission or any
- 8 individual Commissioner.
- 9 Let me start by saying I disagree a little bit
- 10 with some of the earlier state panelists. Maryland does not
- 11 consider the PJM markets as the sole definer or resource
- 12 adequacy and reliability. And let me tell you why.
- 13 First of all as my former Chairman Nazarian used
- 14 to say -- if the lights really do go out Maryland rate
- 15 payers are not going to storm Valley Forge with pitchforks
- 16 and torches. They are going to come to the Maryland
- 17 Commission and they are going to say how did you let that
- 18 happen?
- 19 And when we talk to that reporter from the
- 20 Baltimore Sun we don't want to be in a position of saying,
- 21 "Well Dr. Bowring and President Ott told us it was all going
- 22 to be fine." We are not going to rely on that alone.
- 23 And there's a real reason in the real world. In
- 24 2007 PJM came to the Maryland Commissioner and said you guys
- 25 are in trouble. You aren't going to have enough capacity to

- 1 meet your summer peaks in the future, you better do
- 2 something. They knew they aren't going to get new
- 3 generation they aren't going to get new transmission in
- 4 place in time.
- 5 So Maryland did do something and what we did was
- 6 we issued what we called the Gap RFP and we our distribution
- 7 utilities enter into contracts with demand response
- 8 resources. We got 400 megawatts of demand response
- 9 resources that could be activated immediately.
- 10 Interestingly we did that through a contract for
- 11 differences -- not unlike the one that we signed -- had the
- 12 utilities sign with CPV. So we put 400 megawatts into the
- 13 capacity market same instrument, nobody said a peep. Nobody
- 14 claimed that we were cratering the market or depressing
- 15 prices artificially, it all went smoothly and we stepped in
- 16 and cooperatively we got the job done between the economy
- 17 tanking and all the rest, we never did have the lights go
- 18 out thankfully.
- 19 So first of all we are not relying solely on Dr.
- 20 Bowring and President Ott. The second thing I would want to
- 21 say is as long as the capacity markets fundamental premise
- 22 is it is going to be cost based and resource neutral there
- 23 will be conflicts with state's environmental policies.
- 24 State environmental policies by definition are
- 25 not resource neutral. We have been at this for a long time

- 1 in Maryland. Indeed even before there were capacity
- 2 markets. In 2004 Maryland put in our RPS and we have been
- 3 using a system of RECS to encourage renewable resources in
- 4 Maryland for over 10 years now.
- 5 2008 we enacted our Empower Energy Efficiency
- 6 programs. In 2009 we adopted a Greenhouse Gas Reduction Act
- 7 which we implement through RGGI. So we have been messing
- 8 with the FERC markets for a long time and I don't think we
- 9 have had any terrible impacts.
- 10 I don't think the market has gone to hell in a
- 11 hand basket but I do agree with the New York folks that said
- 12 we really need to rethink the basics of are we going to
- 13 continue to be cost based and resource neutral or do we want
- 14 to start rethinking how we are sending signals out of that
- 15 capacity market, thank you.
- 16 MR. QUINN: Thank you, President Mroz?
- 17 MR. MROZ: Mr. Quinn, Commissioners, thank you
- 18 for having me. It's good to be here and I do appreciate the
- 19 FERC undertaking this effort. I think it is a conversation
- 20 that is not only worthwhile but will be very valuable.
- 21 However it is quite clear there are many opinions, there are
- 22 many moving parts and my comments today will be sort of
- 23 confined at least for this afternoon's purpose to what forms
- 24 my opinions as President of the New Jersey Board of Public
- 25 Utilities.

- I think some of you know I have a perspective
- 2 that's informed from other affairs that responsibilities I
- 3 have first is the President of OPC, the second as Chairman
- 4 of the Critical Infrastructure Committee for NERUCK although
- 5 I am not speaking for either of those organizations
- 6 officially today.
- 7 Nevertheless in New Jersey's experience as most
- 8 of you know we have a diverse generation portfolio. We have
- 9 45% of the electricity that's generated comes from nuclear,
- 10 approximately 45% comes from natural gas and the rest is a
- 11 mix of other sources of fossil fuels as well as robust
- 12 renewable energy portfolio.
- 13 We are proud of that. It is one that in my
- 14 estimation years ago when New Jersey and the other states
- 15 talked about how the markets would evolve there were
- 16 probably expectations that generally that diverse portfolio
- 17 would still be around.
- 18 Today, largely because of what's happened in the
- 19 last several years because of the price of the fuel source
- 20 this discussion and the way we look at the markets has
- 21 changed dramatically.
- That in and of itself is one factor
- 23 as to what is driving this and a number of the presenters
- 24 earlier today in fact remarked about that how we are now
- 25 shifting the focus of what the markets might need to

- 1 consider in terms of valuation.
- 2 That is just one general observation and I have
- 3 been very vocal to say that I think the market needs to
- 4 value these very important resources like our nuclear
- 5 resources in New Jersey. For the reason I mentioned which
- 6 is they are valuable, they continue to help to provide for
- 7 the long-term a diverse energy mix.
- 8 And that is one aspect that is not quantified
- 9 within the marketplace. It's one now that I think for both
- 10 reliability purposes as well as long-term pricing we do need
- 11 to give thought to it.
- 12 And the reliability aspect is one that hits home
- 13 for me. As the President of the Board I not only have a
- 14 responsibility being the Chairman but also the Chief Energy
- 15 Officer of the state and the reliability aspects are ones
- 16 that hit home if there are outages just like Mr. Erwin said.

- 18 The Maryland Commission would be equally as put
- 19 upon to answer the questions if the lights go out. So
- 20 resource adequacy is important to us but I look at it in
- 21 terms of the practical aspects of it. What if there is
- 22 impingement to fuel sources?
- 23 In New Jersey we had a looming threat of that
- 24 this last year, the first order of a contingency for ramp
- 25 down of gas supply would be to natural gas generation in New

- 1 Jersey which I was very concerned about.
- 2 So I look at the situation of whether we can
- 3 maintain orderly markets to ensure this diverse portfolio of
- 4 energy markets across the PJM, whether we are valuing them
- 5 appropriately and in fact going one step further and I want
- 6 to thank PJM for the work they have done in the last couple
- 7 of weeks particularly.
- 8 To start a conversation about what goes behind
- 9 just the generation sources and this does widen the
- 10 conversation admittedly. To consider what the additional
- 11 costs are associated with the bulk power systems delivery of
- 12 that energy transmission, pipelines and other associated
- 13 infrastructure.
- 14 I think about it in that respect also from a
- 15 consumer's standpoint. In New Jersey there's infrastructure
- 16 which is being built in and around nuclear plants and I
- 17 think to myself if those plants were to go away and those
- 18 assets -- those transmission assets had to be upgraded and
- 19 residents of PJM, consumers of PJM continue to have to pay
- 20 for those we end up with stranded costs.
- 21 So there are aspects I believe to what the market
- 22 really should start to consider beyond what we have already
- 23 talked about from a reliability standpoint as well as a more
- 24 holistic view of the way we value this bulk power system.
- 25 So I know that probably broadens the

- 1 conversation, maybe even complicates it further from what we
- 2 started to talk about but I do believe that there are many
- 3 aspects that the marketplace can and should value less as we
- 4 are seeing states do go and on a state by state basis begin
- 5 to value those themselves.
- 6 Now New Jersey has not spoken, our legislature
- 7 has not taken a position on these issues, my Governor has
- 8 not and I certainly respect them and any future policy
- 9 statements they may make on these issues.
- 10 But for the time being the New Jersey Board will
- 11 continue to look at this as a reliability issue, continue to
- 12 support the markets and also to advocate for the marketplace
- 13 to value in all of these externalities, thank you for having
- 14 me.
- 15 MR. QUINN: Thank you, Vice Chairman Place?
- 16 MR. PLACE: Thank you very much. It's a great
- 17 pleasure to be here, thank you for the opportunity. I'd
- 18 also note that my opinions are solely my own. It's I think
- 19 a valuable progression here moving from Maryland to New
- 20 Jersey to Pennsylvania.
- 21 The markets have served us well. It doesn't
- 22 guarantee that they will always serve us well. There are
- 23 clearly tweaks to the capacity market that we would favor
- 24 however if you are looking and thinking about the
- 25 conversations this morning and into this afternoon the

- 1 issues in New England and New York that's our future likely
- 2 if we are not thinking about these issues today.
- I am fuel agnostic. I would argue -- I'd be
- 4 careful of thinking that Pennsylvania should go further than
- 5 we already have or much further than we already have in
- 6 selecting resources, bilateral contracts. We have a
- 7 successful APS, we have a successful energy efficiency
- 8 however they would be largely on the margins and the impacts
- 9 to the markets functioning as being arguably minimal to
- 10 date.
- 11 But given the conversation about what we do in
- 12 nuclear we have 10.3 gigawatts of nuclear within the
- 13 Commonwealth. These are substantive suddenly -- substantive
- 14 conversations whether it is today or next year or the year
- 15 after.
- 16 So that gets us to what can we continue to
- 17 function well if we select for example ZEC and I would argue
- 18 that I would rather -- much rather see an integrated carbon
- 19 price that's fuel agnostic and I don't think it will create
- 20 issues for reliability and I think you can do that within
- 21 the energy market and I think you can deal on the border
- 22 issues and do it well.
- 23 I question whether we can do it on the RTO level
- 24 preferably of course it is more efficient to do it that way,
- 25 it's cleaner to do it that way, it's more elegant to do it

- 1 that way but I don't write off the possibility within the
- 2 Commonwealth. We could conceivably do it and manage the
- 3 complexities within a broader RTO without disturbing the
- 4 market.
- 5 And if we do it by doing a carbon matter you are
- 6 getting better price signals and even if you want to do a
- 7 hybrid approach the state wants to do for example off-shore
- 8 wind, you can layer that on to the underlying carbon price
- 9 and at least the carbon price has mitigated much of the
- 10 impact of introducing that state attributed to that state
- 11 resource of the market.
- 12 So for those reasons I do think that that's
- 13 hopefully our future. I do not -- I'm not in the
- 14 legislature, I'm not at the Governor's Office, they have not
- 15 opined on this but I would argue that if looking at the
- 16 future that is before us with a crystal ball these are
- 17 doable, they don't infringe on FERC's responsibilities.
- 18 It is within the market, it doesn't impede not
- 19 necessarily market power so with that I will continue on.
- 20 MR. QUINN: Thank you, Chairman Sheahan?
- 21 MR. SHEAHAN: Thank you I appreciate the
- 22 opportunity to be here. When I was thinking about it I knew
- 23 I would be on the hot seat but not quite literally the hot
- 24 seat. It's warm in here.
- 25 Illinois has a long history of progressive with a

- 1 small "p" leadership in environmental energy policy. The
- 2 Illinois Renewable Portfolio Standard and Energy Efficiency
- 3 Portfolio standards were enacted in 2008. In 2011 the state
- 4 enacted EMA which was primarily directed at Illinois energy
- 5 infrastructure but also to enable a broader array of energy
- 6 efficiency and demand response programs.
- 7 More recently of course the General Assembly
- 8 enacted the Future Energy Jobs Act which among other things
- 9 created ZEC. Adoption of FIJA and the zero emissions
- 10 standard provisions in particular are a continuation of
- 11 Illinois long history of addressing climate change and the
- 12 environmental impact of in-state generation by taking into
- 13 account events and circumstances affecting the state's
- 14 electric industry.
- 15 The ZEC program promotes the environmental
- 16 benefits of carbon free nuclear generation by unbundling the
- 17 negative externalities associated with carbon based
- 18 generation given them economic value and allowing
- 19 carbon-free generation to receive that value.
- 20 In terms of the RTO's role they play an important
- 21 role and they will continue to play an important role.
- 22 Apart from providing and operating markets the RTO's as you
- 23 know currently have processes to identify future capacity
- 24 needs.
- 25 But markets are not synchro-synced. They exist

- 1 to serve state purposes. And it is important for this
- 2 discussion I think to recognize and respect that states like
- 3 Illinois that have legitimate environmental concerns have
- 4 the legal authority to require and encourage those markets
- 5 to reflect those priorities, thank you.
- 6 MR. QUINN: Thank you. So I think we heard and
- 7 this actually was a nice kind of progression of you know how
- 8 much of what we are attempting -- what the states are
- 9 attempting to accomplish with their policy objectives can be
- 10 accomplished within the markets and how much of it has to
- 11 take place outside of the market.
- 12 Or even I think what Mr. Erwin said some of the
- 13 things that the market is attempting to accomplish itself
- 14 whether the states want to accomplish those things as well
- 15 or provide some sort of compliment.
- One of the pre-Conference statements talked about
- 17 the fact that because of the integrated nature of the PJM
- 18 market any one state's decision necessarily flows into the
- 19 market outcomes that the other states are going to
- 20 experience.
- 21 And that there can either be conflict -- direct
- 22 conflict between, what one State is pursuing and what
- 23 another State is pursuing or simply just a side effect that
- 24 one State is pursuing a set of policy objectives that will
- 25 influence the market outcomes of another set of resources.

- 1 You know I think I heard from both New Jersey and
- 2 Pennsylvania a sense that within the market the more of
- 3 those things that can take place within the market the less
- 4 the potential conflict is.
- 5 But I guess I would like to hear from all of you
- 6 what role you think the RTO plays in resolving any potential
- 7 conflicts among states. If the PJM market isn't the place
- 8 where those conflicts will be resolved, what's the other
- 9 forum for resolution?
- 10 MR. MROZ: Well let me start because I've given
- 11 that issue some real serious thought and I think that's
- 12 something many of us in the PJM states are grappling with.
- 13 First is regulators and looking at both the generation and
- 14 resource adequacy mix as well as what the structure could be
- 15 to work through those issues.
- 16 As the President of the New Jersey Board when I
- 17 came to the position 3 years ago I was struck by the fact
- 18 that we really no longer have the apparatus to evaluate the
- 19 broader set of questions that was available to Commissions
- 20 in PJM before de-regulation when we had IRP. We just don't
- 21 have the resources, we don't have the bandwidth, we don't
- 22 have the staff, we don't have the structures in place to
- 23 inform us as state regulators at this point in time.
- It actually points out to me what I think is
- 25 largely and I don't mean it in a regulatory sense -- a gap

- 1 in terms of the work that should be going on. I have had
- 2 many conversations with the representatives of PJM about how
- 3 PJM can and should fill part of that void. I think a lot of
- 4 work they have done recently helps.
- 5 At the same time I think it is incumbent upon us
- 6 as state regulators, individually and collectively along
- 7 with FERC, along with PJM to think about how to fill that
- 8 void and to manage those issues in a better way.
- 9 I'm reminded and I mentioned this many times when
- 10 I have spoken about these issues that our colleague from
- 11 Ohio Chairman Hock had talked about an enhanced planning
- 12 collaborative in the context of time about transmission
- 13 issues.
- 14 It seems to me that that concept is equally as
- 15 applicable to both transmission as well as it is to
- 16 generation mix and it may be that there should be some
- 17 consideration how we can have a vehicle like that in the
- 18 region to better inform and to give us collectively the
- 19 tools to work through these issues in the future.
- 20 MR. ERWIN: Certainly Maryland would prefer that
- 21 the states work out these issues with the other states. The
- 22 collaborative process certainly we have been very active
- 23 participants in OPC that's the level, but our preference
- 24 would be to find solutions to those.
- 25 Now because we have been active in OPC we also

- 1 realize that's a hard group to get to come together.
- 2 President Mroz working for OPC is kind of like herding the
- 3 ants I suspect. And we do understand that.
- 4 The second place we would like to see those kinds
- 5 of things all go in the stakeholder processes at PJM. What
- 6 we don't want to see is either FERC or PJM becoming if you
- 7 will a court in which the various states fight out their
- 8 various policy -- that's not the way it ought to be done.
- 9 MR. PLACE: Yeah and in the course I would
- 10 reinforce what was just said by both speakers and I clearly
- 11 don't see a role for PJM or FERC to really be an arbiter or
- 12 a judge as pointed out in this. There should be a path
- 13 through the models in which we built -- the markets had
- 14 built.
- 15 But for lack of a better way to phrase it there
- 16 is always going to be tension between the states and this
- 17 isn't the only venue in which we have tension they go back
- 18 to the dawn of time. So perhaps I would caution my own
- 19 thoughts on this so that there will be bruises and dings in
- 20 this process and that is unavoidable.
- 21 MR. SHEAHAN: Yeah Brien Sheahan. I think that
- 22 you know my colleague's suggestions are good. I think you
- 23 know regulators across states work well together. We are
- 24 often in the same region or national associations and I
- 25 think we can definitely work through these.

- 1 But I don't know that the conflict will
- 2 necessarily be between states. It seems to me it is really
- 3 sort of a business competition between generators. With
- 4 respect to Illinois' situation if a state desires cleaner
- 5 generation to support the health of its citizens as the
- 6 legislature has chosen to do in Illinois and that has an
- 7 effect of reducing costs borne by its neighbors. That's a
- 8 benefit not a conflict it seems to me.
- 9 But I think you know whether it is the states or
- 10 PJM or a FERC convened group I think it certainly would be
- 11 preferable to work out these issues in that way, in a
- 12 collaborative way.
- 13 MR. QUINN: Alright I'll ask our Commissioners if
- 14 they have got any questions at this point.
- 15 COMMISSIONER HONORABLE: Of course we do Arnie
- 16 thank you. And my dear colleague Cheryl was kind enough to
- 17 give me the mic first thank you Cheryl. And good afternoon
- 18 gentlemen I think all of you were sitting in the room
- 19 earlier when I said I get where you are.
- 20 You best hit on particular I think is quite
- 21 interesting because you are teeing up for us different
- 22 challenges and certainly with regard to Maryland, Illinois
- 23 in particular we have had different tensions I would say and
- 24 I acknowledge Judge Brenner who is sitting out in the room
- 25 -- I was shocked that he came back to us after that case but

- 1 we are so glad that Larry did -- he's shaking his head.
- 2 This it's a new a different time for PJM as well
- 3 and you all have touched on some of the things I wanted to
- 4 ask you about but I wanted to ask the questions more broadly
- 5 so that if others of you have points of view you can raise
- 6 those as well.
- 7 One of you teed up the fact that the current
- 8 wholesale market construct may be sufficient to focus on
- 9 lowest cost resources in a way that's fuel neutral.
- 10 However, President Mroz has said we really should be
- 11 thinking about other attributes and valuing those.
- 12 And I wanted to ask the other panelists and give
- 13 the other gentlemen time if you want another bite at the
- 14 apple, do we need additional valuation of attributes in
- 15 wholesale markets to meet your needs?
- 16 MR. ERWIN: Thank you Commissioner. My view
- 17 would certainly be yes and I think that was reflected in our
- 18 pre-filed statement. We would not encourage either you or
- 19 PJM to continue to tweak the RPM or the MOPR. We would
- 20 agree with Dr. Patton the MOPR originally states we are
- 21 exempt from the MOPR.
- 22 Our resources weren't subject to the MOPR and it
- 23 wasn't until we started doing things that somebody said wait
- 24 a minute, you need to be subject to the MOPR.
- 25 Every single year there have been proposals for

- 1 changing RPM and we don't think that continuing to try to
- 2 tweak that model is going to be very constructive. We do
- 3 need to go back to the basics and rethink and say what is it
- 4 we really want and what do we want the market to value and
- 5 that's going to be over and above just the cheapest.
- 6 The other thing I would want to share with you is
- 7 do you really want to get rid of all the nukes merely
- 8 because they are uneconomic, is that really a good idea?
- 9 I'm saying no too. If we do get to a point where
- 10 renewables are 40-50-60% of our generation you are going to
- 11 have more and more important of an issue of that resource
- 12 mix for the base and do you really want it all gas? That
- 13 makes no sense to me.
- 14 So you are going to have to have those markets
- 15 start looking at more than just the cheapest and say too bad
- 16 nukes you are not efficient goodbye. We don't think that
- 17 construct is going to be very good going forward.
- 18 COMMISSIONER HONORABLE: And to your point I
- 19 appreciated that PJM report that recently issued speaking to
- 20 not only the value of fuel diversity but a balanced
- 21 portfolio and I think that's the point you are trying to
- 22 make, anyone else?
- 23 MR. SHEAHAN: Yes Brier Sheahan. I would
- 24 certainly agree with that 100%. I think that states like
- 25 Illinois have every right to value the environmental

- 1 attributes of certain generation but wholesale markets
- 2 certainly could be a mechanism to price it so long as it
- 3 respects the state's goals.
- 4 So in other words I think if you did it
- 5 region-wide and your RTO decided well those attributes maybe
- 6 you know would be more economic to accumulate somewhere else
- 7 and you end up with sort of pollution centers in particular
- 8 areas, then that would be an example where the wholesale
- 9 market wouldn't be an appropriate mechanism for that.
- 10 MR. PLACE: Yeah I'm torn. I would probably come
- 11 down on thinking that I would rather see you tweaking the
- 12 capacity markets than starting fresh. Although it comes
- 13 with a lot of baggage, it comes with a little complexity, it
- 14 comes with a lot of constraints that are challenging to
- 15 quantify.
- 16 However, I think in the aggregate it's a pretty
- 17 fair way to think about it. But that's it if we are talking
- 18 about big chunks, the nuclear issue deal with it on the
- 19 energy side and use the capacity markets. We can deal with
- 20 some of the more marginal issues of state priorities in the
- 21 capacity markets arguably.
- 22 But to me the energy market is simply a better
- 23 mechanism that's why I come down on thinking about
- 24 incorporate a carbon side, a carbon issue to it. There's a
- 25 better way to think about it and the rule of Goldberg or

- 1 that end dimensional complexity of the capacity and space.
- 2 COMMISSIONER HONORABLE: I'd next like to move to
- 3 something that a number of you have teed up also and that is
- 4 the proper role of the RTO or ISO and the proper role of the
- 5 federal regulator. Really what I have heard from you is
- 6 that we really should take a more supportive role.
- 7 I hear you loud and clear, especially Rick about
- 8 the stakeholder process, the fact that you are challenged as
- 9 it is too to have the resources and manpower to represent
- 10 the interest of your respective states and regulators as a
- 11 whole as you are pursing the public interest. I appreciate
- 12 that having been a part of OMS and the Inter-regional State
- 13 Committee and the Southwest Power Pole Regional State
- 14 Committee and I understand the investment of time and effort
- 15 and resources and that it has worked and that there have
- 16 been times when you have been able to work collaboratively
- 17 together and I want that too.
- 18 I want to say that on the record that I think
- 19 that is a terrific way because it supports the vibrancy and
- 20 robustness of stakeholder processes which I think lends to a
- 21 healthier process overall if you are continuing to come here
- 22 to fight it out or tell on the other one, you will always be
- 23 ready to shoot first and ask questions later rather than
- 24 sitting around working through the challenges.
- 25 So I too want more and better collaboration but

- 1 this gets to the heart of my concern that you may find with
- 2 us as well. I want to get to the heart of what you see as
- 3 tensions as it relates to your interaction with FERC or
- 4 FERC's oversight of markets. So I walked into that kind of
- 5 gently but I would like some straight answers.
- 6 Tell me what you think the problem is and if
- 7 there is one with regard to our work with regard to markets
- 8 in the PJM region and what you see as a pathway forward to
- 9 resolving those?
- 10 MR. MROZ: Where do you want us to start? Let me
- 11 first go back to I think Commissioner your first question
- 12 was the way we view the interaction with PJM or what we
- 13 would like to see out of that relationship.
- 14 Let me just in the context of what we are talking
- 15 about here today which is really about generation. It's
- 16 multiples I can tell you and report to you from my
- 17 perspective the relationship with PJM has been very
- 18 positive. Of course there are aspects of what go on in the
- 19 process that as you well know as a former state regulator
- 20 that we don't often know.
- 21 We as the state regulators because what I said
- 22 earlier about not really having an apparatus around the
- 23 planning process anymore, we are the last to find out often
- 24 times even when a generation facility is being sited in our
- 25 state.

- 1 And if we are going to have a more robust
- 2 discussion about where -- what our responsibilities are, our
- 3 need to assert ourselves as the responsible parties around
- 4 resource adequacy we need to be talking about that as well.
- I will report though as I said that conversation,
- 6 that even collaboration with PJM from New Jersey's
- 7 perspective has been very positive in my tenure. In terms
- 8 of what else we would like to see from my perspective it is
- 9 first this kind of discussion really asking the questions of
- 10 what it is that we want and I appreciate you and
- 11 Commissioner LaFleur even asking the questions that way.
- 12 What is it that we need or should have? And we
- 13 will give you direct answers about that so that's the first
- 14 step. I can heretofore -- I would say the perspective has
- 15 been almost too hands off and an unwillingness to deal with
- 16 these issues.
- 17 We have heard a number of presenters earlier
- 18 today talk about the fact that these issues need to be dealt
- 19 with soon and it is incumbent upon all of us I think to do
- 20 exactly that. To work through and identify what's needed
- 21 and try to identify solutions and try to implement them for
- 22 the short-term and long-term but do something relatively
- 23 quick lest as I said, as other presenters said is happening
- 24 with at least a place like Illinois where the states are
- 25 proceeding on their own to deal with those issues.

- 1 MR. SHEAHAN: Yeah I would say from Illinois'
- 2 standpoint the markets don't value the externalities that
- 3 the state values, particularly the environmental attributes.

4

- 5 But also the other valuable attributes of base
- 6 load nuclear. In terms of urgency I have had an interesting
- 7 conversation the other day with a principal and we talked
- 8 about urgency. This was an urgent conversation of three
- 9 years ago, this is a crisis today.
- 10 And just to kind of put a finer point on it given
- 11 the you know, challenges that Illinois has to pass the
- 12 legislation it did in the veto session really said
- 13 something, it should say something.
- 14 I mean this is really critical for states like
- 15 Illinois. It's very important and so the time for urgency
- 16 is sort of past.
- 17 MR. ERWIN: First for Chairman LaFleur as a
- 18 battle scarred veteran of the recent legal wars let me say
- 19 that Maryland certainly prefers the collaborative approach
- 20 to litigation, both as a loser in Hughes v. Tallon and as a
- 21 winner in Epso versus FERC because we came in at the Supreme
- 22 Court supporting FERC.
- 23 But in both cases I don't think the litigation
- 24 world is the best way to go. I think that collaborative
- 25 processes at the PJM level are where hopefully these kinds

- 1 of questions can be addressed and I want to publically thank
- 2 PJM for its recent work in working with Maryland to find
- 3 aggregation for our demand response resources for the
- 4 upcoming May DRA and we look forward to continuing to work
- 5 with PJM to be able to expand that effort.
- 6 So we have been able to work with PJM. They have
- 7 been responsible and responsive and we look forward to
- 8 continuing that.
- 9 The one thing I would caution for FERC is I think
- 10 it is important for you to encourage diversity. This should
- 11 not be a top down one size fits all solution to all of these
- 12 problems. Different RTO's and ISO's can and should be
- 13 encouraged to find different solutions so that we can
- 14 experiment at that level rather than say okay here's the
- 15 solution.
- MR. MROZ: And let me make one further comment
- 17 Commissioner and this goes to maybe a suggestion that you
- 18 want to further explore with the industry and even with the
- 19 RTO's.
- 20 One of the continuing concerns with multiple
- 21 issues around an RTO like PJM because of so many interests
- 22 that are part of that process, and by the way the first to
- 23 be obviously to defend a process for all the voices and all
- 24 the interests are accounted for and have their voice heard.
- 25 But it is that process in an RTO like PJM that has 14

- 1 separate jurisdictions that the process itself can be
- 2 weighing down any solution and you will hear that from
- 3 others that that's where I think at least from FERC's role
- 4 we can see, ask for the leadership that helps to move that
- 5 solution through that process.
- 6 MR. PLACE: I'll try not to belie the point at
- 7 the risk of stating the obvious. The heterogeneity in these
- 8 questions is only going to increase and you think about the
- 9 conversations we have had here, think about what California
- 10 has done -- there are, unlike any time before there is a
- 11 need for both bilateral going from the states within the
- 12 RTO's to FERC and reverse.
- 13 If we don't do that successfully bridge under
- 14 what President Mroz said that's where the rubber is going to
- 15 hit the road. If we could do this in a timely manner --
- 16 again stating the obvious in a way but that back and forth
- 17 process, the collaborative we understand -- we need to
- 18 understand your constraints as you understand the creative
- 19 ways that we bring our state issues through this process.
- 20 COMMISSIONER HONORABLE: Thank you gentlemen.
- 21 This is very helpful and I appreciate it that you thought
- 22 before you rattled off a list of 20 things that we do
- 23 horribly wrong but more importantly I appreciate the fact
- 24 that you thought about how you are interacting and how
- 25 stakeholders are interacting with PJM and how you are

- 1 interacting with us and how we can do so in a way that
- 2 allows us all to keep our eyes on the prize and reducing
- 3 litigation -- additional years Brien of waiting around for a
- 4 solution, thank you so much.
- 5 CHAIRMAN LA FLEUR: Thank you Colette -- well
- 6 here we are in PJM the largest RTO, certainly
- 7 extraordinarily diverse in the different political
- 8 eco-systems with states as different as Maryland and West
- 9 Virginia even though they touch each other, different
- 10 political economies.
- 11 And another difference in PJM is I think it is
- 12 fair to say you are a little earlier in the process of
- 13 discussing this certainly than New England which has been at
- 14 it for some months and even then New York.
- 15 So I guess -- I just want to ask we talked a lot
- 16 this morning and I know you were all here about different
- 17 ways for RTO's to look at working state policies into the
- 18 markets and the two basic bottles, one was people were
- 19 calling it achieve to kind of define an attribute and have
- 20 the market price it.
- 21 And I know President Mroz talked about
- 22 resilience, something that PJM has been talking about. I
- 23 know they did some of that in capacity performance but
- 24 talking more about pricing resilience and certainly we know
- 25 the market can price carbon if it is asked to and so forth

- 1 while finding an attribute and pricing it.
- 2 And the other is to just let the states all have
- 3 different goals and find an accommodate solution like
- 4 multi-tier pricing or other solutions that let the states go
- 5 in different directions.
- 6 I am interested in your thought of what might
- 7 work. And what strikes me is that we have just heard two
- 8 states with Chairman Sheahan talk about valuing nuclear
- 9 units for their environmental externalities first and
- 10 foremost or for their lack of environmental externalities
- 11 and you, President Mroz talk about valuing them for other
- 12 attributes.
- You know, do you think we can agree on
- 14 attributes? Do you think we should go an accommodate
- 15 solution? I mean because we are a little earlier and can go
- 16 different paths here.
- 17 MR. MROZ: I'll answer first since I'm the one
- 18 that sort of went at this issue directly. I do think that
- 19 we can value the other attributes. The question is whether
- 20 we all agree about what those valuations are or what the
- 21 attributes are.
- 22 But I do think that we need to start to have that
- 23 conversation. First is fuel diversity. Other industries
- 24 undertake, other businesses they undertake concentration
- 25 analyses all the time whether they are in their -- if it is

- 1 a financial institution and there are investments, if it is
- 2 a manufacturing facility who they sell to one client or just
- 3 a small number.
- 4 Those are classic business decisions that are
- 5 made on risk analysis every day in all industries and we are
- 6 not doing it. You can start there. We can begin to also
- 7 look at the issues I mentioned of other related
- 8 infrastructure investments that are attended to existing
- 9 generation that otherwise would either have to be stranded
- 10 or if there is replacement generation, what the relative
- 11 cost of those other investments might be. Those are
- 12 conversations that we don't have like I said without ROP,
- 13 without even a semblance of it.
- 14 We no longer are even able to identify what they
- 15 might be. However it is the beginnings of the work that PJM
- 16 has started to undertake where we have had those
- 17 conversations I think are the kinds of questions we have to
- 18 ask and the kinds of issues we need to consider about
- 19 whether they should be attributes to value.
- 20 CHAIRMAN LA FLEUR: I just want to say I've seen
- 21 some work that actually shows -- even though it seems
- 22 contrarian that since we went to the competitive markets
- 23 some regions are more diverse because they used to be
- 24 extremely heavily coal and now with gas and some of the coal
- 25 still left and nuclear there is some evidence that there is

- 1 more diversity.
- 2 Is it the type of diversity you are getting? Do
- 3 you think the dependence on gas is that what scares you?
- 4 MR. MROZ: Yes, in a word yes. And I come back
- 5 to without getting too specific you know in New Jersey where
- 6 we saw last year the potential for impingement on supply
- 7 into the state which would mean the first order or
- 8 curtailment was generation. Those are the things that scare
- 9 me.
- 10 And we just don't know enough about what might be
- 11 the risks associated with that oversupply in natural gas.
- 12 MR. SHEAHAN: Brien Sheahan. PJM tolerates a lot
- 13 of out of market you know rate base generation and you know
- 14 REC's of course in various states. I think it really kind
- 15 of remains to be seen whether the market has to do anything
- 16 to adjust or accommodate the state's support for the
- 17 environmental aspects of nuclear generation.
- 18 And if resource adequacy does become a problem
- 19 PJM certainly has a lot of tools to deal with that which
- 20 they could apply across all generating types. So I don't
- 21 know that it's necessarily that that's the problem today.
- 22 CHAIRMAN LA FLEUR: And some of those other --
- 23 I'm forgetting the acronym that FRR where people can go
- 24 entirely find their own generation. It's part of an
- 25 organized structure but yes there's more critical mass in

- 1 PJM. Anyone else?
- 2 MR. PLACE: If I may I would caution again I go
- 3 back and find that legislature has blown up my car. But I
- 4 would caution states to be careful. I think if we try to
- 5 monetize every attribute that we see a value we put at risk
- 6 the transparency and the simplicity and the cost efficiency
- 7 of the market we have.
- 8 That brings absolute benefits, certainly in
- 9 Pennsylvania and certainly across PJM. This is an
- 10 enormously valuable market for us and trying to get it to
- 11 solve all of our problems may be in an ethereal way or a
- 12 theoretical way admirable.
- 13 But I caution that it could end up with
- 14 inadvertent consequences of dragging down the values we see
- 15 here, the transparency and the simplicity. It doesn't mean
- 16 that I won't go home tonight and say man we need to do this
- 17 but I would just caution myself and perhaps others in my
- 18 state to think through that carefully.
- 19 MR. ERWIN: Certainly Chairman, Maryland does not
- 20 see an adequacy problem in PJM. They've got what 22% over
- 21 and above when their resource is supposed to be 15. So we
- 22 are already paying for an awful lot of generation out there
- 23 that potentially isn't used at all.
- 24 And certainly Maryland is and I'm sure these
- other guys are too. There's only one source of revenue for

- 1 all of this and that's your neighbors and my neighbors. We
- 2 can talk about markets and all of this kind of stuff but the
- 3 bottom line is rate payers and we need to be cognizant of
- 4 that.
- 5 For PJM I think what they need to think about is
- 6 the resource mix, not adequacy. And I'm not convinced
- 7 necessarily that the changes in the marketplace are totally
- 8 due to PJM's "signals". I think a lot of them are just
- 9 market fundamentals -- cost of gas, cost of coal, those
- 10 kinds of basic market driven things are causing at least PJM
- 11 to diversity and it is not really because we have this
- 12 elegant signal coming out of the capacity market.
- 13 CHAIRMAN LA FLEUR: And I didn't mean to say that
- 14 it was. It's just I think there is diversity. It wasn't a
- 15 direct consequence because it was run as a fuel neutral
- 16 commodity market. I guess I'll shut up and keep us on time,
- 17 thank you very much gentlemen.
- 18 MR. QUINN: Alright thank you very much. We are
- 19 going to ask our State representatives to move off the hot
- 20 seat and into the warm seats. We really want to stay on
- 21 time as much as possible so I would love to get the next
- 22 session going by five minutes to so I know people want to
- 23 get up and stretch your legs a little bit but we would
- 24 really love to have this going again in about five minutes.
- 25 Panel 2

- 1 MR. QUINN: I would remind you all that it is 4
- 2 p.m. If we go for an hour and a half that's 5:30, you will
- 3 all be tired. I know I will be tired. So we are pleased to
- 4 start the last session or the last panel of the day.
- 5 I'm thankful for our panelists to have waited
- 6 around all day to get your turn to answer what we hope will
- 7 be you know, not the same set of questions that we have been
- 8 asking all day -- at least have a different kind of
- 9 conversation than we have been having all day.
- 10 I'll start by introducing and thanking our
- 11 panelists. We have Andrew Ott the President and Chief
- 12 Executive Officer of PJM.
- 13 We have Joseph Bowring who is the President of
- 14 Monitoring Analytics. We have at some point Paul Bailey the
- 15 President and Chief Executive Officer of American Coalition
- 16 for Clean Coal Electricity.
- 17 We have Jennifer Chen who is from the Sustainable
- 18 FERC Project at the Natural Resources Defense Council. We
- 19 have Michael Cocco, your names are all in a slightly
- 20 different order than my list -- from Old Dominion and
- 21 representing NRECA.
- 22 We have Craig Lathrop from PSEG Energy Resources,
- 23 Robert Flexon from Dynegy, Gregory Poulos the Consumer
- 24 Advocate of the PJM states and finally Raja Sundararajan
- 25 from American Electric Power.

- 1 So we will basically follow the same format we
- 2 have been following for the earlier sessions. We are going
- 3 to go to the Commissioners a little earlier because acting
- 4 Chairman LaFleur needs to leave the meeting by about 4:45 so
- 5 we will kind of forward order the Commissioner camp and then
- 6 maybe pitch it back over here if we still have some time
- 7 remaining.
- 8 So I would maybe start this panel discussion off
- 9 slightly differently than we have started the other panels,
- 10 just mostly to mix it up a bit. I had a sense from some of
- 11 the pre-Conference statements that, especially in the PJM
- 12 states potentially because you are a little earlier on in
- 13 the process but maybe just because of the history that we
- 14 have had with the PJM markets.
- 15 A certain affinity for the hybrid approach that
- 16 we referenced in some of the questions where to some extent
- 17 for some state policies and state objectives stakeholders
- 18 believe the commission should provide more deference, not
- 19 attempt to interfere and feel no real need to come.
- 20 Accommodate only in the sense of try to let those
- 21 policies move through the market with as little impediment
- 22 as possible. But then another set of policies that
- 23 stakeholders felt really needed to be addressed within --
- 24 either addressed completely within the wholesale market so
- 25 flow through the wholesale market or be subject to something

- 1 like the minimum offer price rule where at least the effect
- 2 of that state policy is connected to the market outcomes.
- 3 So I wondered if -- and that's what we were
- 4 thinking about a hybrid where again some state policies --
- 5 we try to be very differential to the states -- another set
- 6 of state policies and objectives we try to integrate them
- 7 into the market or at least make sure that the market
- 8 signals aren't distorted by them.
- 9 If there is any principle we could use to decide
- 10 between those two sets of state policies and objectives. Is
- 11 it the kind of policy, whether it is environmental so
- 12 inherently not part of our market rather than seeing
- 13 something like resource adequacy is clearly a goal that the
- 14 markets were designed to do.
- 15 Is it the size of the state intervention? Small
- 16 things are okay to kind of ignore, big things are things
- 17 that we need to bring into the market. So that's where I
- 18 would like to start the discussion with this panel so I
- 19 picked something you all have a point of view on that,
- 20 Michael?
- 21 MR. COCCO: Good morning I'm Michael Cocco
- 22 representing Old Dominion Electric Cooperative and in that
- 23 capacity as a member of NRECA. I would like to thank the
- 24 Commission and the staff for inviting me to share my views.
- 25 I'm a first timer at these types of proceedings so I'm

- 1 especially looking forward to it I think.
- 2 So first ODEC is one of the --maybe the only
- 3 co-op on these panels I would like to address one particular
- 4 issue to particularly this sector. ODEC serves 11 electric
- 5 distribution companies for 4 requirement service. And as
- 6 such we receive a payment from those LSE's -- from those
- 7 EDC's for payment for the services that are provided that
- 8 flow outside of the PJM market settlement system.
- 9 Now just because it flows outside the market
- 10 settlement system we don't consider that to be an out of
- 11 market payment. It's a voluntary contract among the LSE's
- 12 when done at arm's length. And while this point may be
- 13 somewhat intuitive to most of you it is certainly a topic
- 14 that comes up in other forums so I just wanted to address
- 15 that particular point now.
- To -- specifically to your question ODEC believes
- 17 that state sponsored programs can work in harmony with
- 18 wholesale competitive markets. Commissioner LaFleur asked
- 19 the question -- I think it was to the NEPOOL panel and I
- 20 believe I jotted down the question correctly.
- 21 Unfortunately, I may not be able to read my handwriting but
- 22 I think the question she asked was, "Should the Commission
- 23 let the states run with market incentive programs and
- 24 therefore only worry about protecting the price of
- 25 everything else."

239

```
1 The way I view the PJM capacity market let's say
```

- 2 commoditized market. They basically have a stated product
- 3 and a price that is tied to the location. What happens when
- 4 states look to procure different attributes -- they are
- 5 paying for something that isn't valued in the PJM market and
- 6 that's okay.
- 7 I think what then happens is those generator
- 8 entities are left to compete for the remaining money inside
- 9 that commoditized capacity market. So to the question you
- 10 know should there be any action needed to adjust that price
- 11 I would say no. I think the market functions fine. I think
- 12 investment is attracted to the market, you know people are
- 13 going to put capital at risk are going to not only look at
- 14 the markets and going to evaluate the government driven
- 15 platform and make their business decisions accordingly.
- I think the problem is when these state policies
- 17 are targeted as a very unique beneficiary that is not
- 18 generally tied to some public policy objective. Those types
- 19 of distortions in the markets can create problems. And if
- 20 you are an investor, those types of uncertainties are the
- 21 ones that you would like to stay away from, so that's how I
- 22 distinguish those two sets of attributes.
- 23 MR. QUINN: Thank you. So I think we'll go -- I
- 24 saw Andy, Raja, Lathrop and then Robert.
- 25 MR. OTT: So does that mean I'm on? Thank you.

- 1 I appreciate again thank you so much to the Commissioners
- 2 and staff for putting this on and inviting us to attend. I
- 3 think -- first I would just like to differentiate --
- 4 obviously within PJM we have vertically integrated states,
- 5 states that are doing resource planning.
- 6 Then we have states that are depending upon the
- 7 market for competitive investment. So first just in
- 8 differentiating the issues that we see here are where you
- 9 have conflict if you will. So certainly a state that has
- 10 taken responsibility for 100% of the resource adequacy in
- 11 their state through integrated resource plans to cover 100%
- 12 of the load, really see no conflict with state policies
- 13 related to generation there because they have existed you
- 14 know for many years within the wholesale market.
- 15 And certainly, PJM covers both of those types of
- 16 vertically integrated states and competitive states so we
- 17 don't see a real conflict there. I think when you start to
- 18 look at where we get into difficulty it is where states are
- 19 taking targeted actions, if you will, to you know change
- 20 outcomes if you will, for certain generation.
- 21 And I think certain materiality I think does
- 22 factor in into how big of a distortion is it and is it
- 23 something that is material enough that we would see you know
- 24 a harm to the market. And let's face it PJM has gone
- 25 through a significant transition. We have lost probably at

- 1 least 20,000 megawatts of only -- my notes on this in front
- 2 of me of coal-fired plants and the market essentially has
- 3 replaced that with competitive investment.
- 4 We depend upon that market integrity in order to
- 5 preserve the liability. We will be sitting here in a much
- 6 different spot had all of those investors not come in, put
- 7 their capital at risk, taken on that risk for themselves on
- 8 behalf of PJM and all customers if you will to put forth
- 9 that investment and then essentially replaced with very
- 10 little fanfare, a significant amount of retiring generation.
- 11 That's what we are trying to make sure we can
- 12 preserve, that confidence that the investors have the market
- 13 will in fact be equitable in the fair shot. So anything
- 14 that would distract from that or put that in harm's way is
- 15 what we have to address and I would think first materiality,
- 16 second I think is the issue of how targeted is the action.
- 17 In other words if it is a broad action where there is a lot
- 18 of players who could come in and compete you know that would
- 19 be a different method.
- 20 But again where we are at on this and we have
- 21 tried to address this proactively in the past few months,
- 22 put forth -- you probably saw my testimony we have a couple
- 23 of different tracks of activity. First and foremost this
- 24 issue of continuing to fight and have litigation is again,
- 25 as others have said, not a great strategic plan.

- 1 The better strategic plan I think is to harmonize
- 2 if you will, and find ways to take action. Figure ways to
- 3 set aside that impact, if you will, and have a competitive
- 4 side of the market continue forth without major impacts. So
- 5 for the opening comments we will leave it at that, thank
- 6 you.
- 7 MR. QUINN: So I think I have Raja next.
- 8 MR. SUNDARARAJAN: Yes thank you Chairman LaFleur
- 9 and Commissioner Honorable for allowing us to participate in
- 10 the panel. AEP obviously as you know have been operating
- 11 companies in 11 states across the United States and 7 of
- 12 them are in PJM.
- 13 And if you ask any of our 7 states what is the
- 14 most important issue that you care about you get 7 different
- 15 answers. And I can clearly say environmental attributes are
- 16 probably not the top ones. If you asked them what they are
- 17 worried about fuel diversity and long-term pricing is what
- 18 they care about so that they can be assured as I think some
- 19 of the state Commissions and PJM were talking about that.
- 20 The lights go out they are on the hook for the customers to
- 21 call.
- 22 And I think an important distinction because I
- 23 think you get lost into the fact that these are out of
- 24 market or in market. At the end of the day if you asked our
- 25 states who is on the hook for these things the other states

- 1 would say they are on the hook for making sure, not only
- 2 resource adequacy is an issue that is shared with PJM member
- 3 states.
- 4 There are other attributes that are beyond
- 5 resource adequacy that are currently not compensated in the
- 6 markets would particularly belong fully in the states
- 7 control. And states are doing what it takes to pursue
- 8 those.
- 9 If you go to West Virginia or Kentucky they have
- 10 lost 20% of the loads over the last 5 years. Environmental
- 11 attributes are the last thing that comes to their mind.
- 12 They are trying to make sure they have jobs in the state,
- 13 they are trying to promote jobs, get load growth in the
- 14 state. Even without doing anything the retail rate there is
- 15 I have seen a 20% rate increase because of load loss within
- 16 the last 5 years.
- 17 And that's why you see various diversity within
- 18 the PJM states in terms of what the view is. What is the
- 19 burning issue that they are trying to solve from a
- 20 generation resource adequacy point of view? And getting
- 21 agreement with all the states, about 13 states I guess 14
- 22 states is not going to be an easy task. So figuring out a
- 23 solution we are not supportive of if these solutions can be
- 24 solved by market changes, market reforms -- we are fully
- 25 onboard with that.

- 1 The probability of that happening is a little bit
- 2 more so we still thing there needs to be a construct where
- 3 utilities are at low servicing entities can enter into
- 4 bilateral negotiations and enter into a long-term contract
- 5 so that they can solve the issue that the state is
- 6 immediately worried about.
- 7 And this is prevalent in other RPO's, so I think
- 8 we would support some kind of a bilateral contract that the
- 9 LSE's can enter into for capacity and resource obligation
- 10 needs so that they can incorporate these externalities as we
- 11 call it, does not capture the capacity markets.
- 12 MR. QUINN: Thank you, Lathrop.
- 13 MR. CRAIG: Thanks very much. And I'll just
- 14 reiterate thanks to Chairman LaFleur and thanks to
- 15 Commissioner Honorable for organizing this and inviting us
- 16 to come and speak today. I'll probably reiterate a lot of
- 17 positions that have already been stated but the question was
- 18 essentially how do we draw the boundaries around what's
- 19 acceptable and what isn't acceptable.
- 20 I'll tell you that's certainly something that we
- 21 have struggled internally at PSEG in trying to help draw
- 22 those lines so I think it's not surprising that that
- 23 question you know, it still exists and hasn't been answered
- 24 yet. And I think where we have come out on this is it is
- 25 probably always going to be very difficult to draw the line

- 1 or draw the box ahead of time to know exactly where
- 2 everything fits but that said I think we can start to place
- 3 certain things on each side of the line.
- 4 And maybe that's the best we can do for now but
- 5 we should do that and move forward appropriately. I think
- 6 we both have sort of learned a lesson that things are
- 7 clearly just targeted at changing -- I'll use that word the
- 8 price in the market are not appropriate and I don't know to
- 9 what extent we will see something that blatant going on the
- 10 future.
- 11 But clearly I think we have learned that that is
- 12 not acceptable. And on the other side I think that a lot of
- 13 things that we have heard talked about today, you know it
- 14 kind of fits broadly into our minds into two categories --
- 15 environmental goals that have not be internalized in the
- 16 market.
- 17 And then with whatever wording we want to use
- 18 whether it is enhanced resource adequacy or it is fuel
- 19 diversity or we like to call it resiliency -- after some of
- 20 the experiences that our companies had in things like super
- 21 storm Sandy and then the little bit of the scare we had this
- 22 summer as you have heard Commissioner Mroz refer to with a
- 23 potential real gas supply issue that was fortunately fixed
- 24 before the winter came about.
- 25 You know I think those things are states clearly

- 1 expressing their concerns over what are essentially public
- 2 health and safety and welfare issues. We have not yet
- 3 figured out how to or at least agreed on how to internalize
- 4 in the market are entirely appropriate and need to be
- 5 accommodated so that those very valid public policy goals
- 6 are not thwarted while we go through the process of figuring
- 7 out hopefully how to internalize them in the markets which
- 8 we would actually agree is a better way to pursue that in
- 9 the long-term.
- 10 MR. QUINN: Robert?
- 11 MR. FLEXON: Thank you and thank you to the
- 12 Commission for organizing -- this is a fantastic event and I
- 13 appreciate having the opportunity here on the state
- 14 perspectives. I often don't get that and particularly
- 15 getting them all at once certainly helps shape the thinking.
- 16 I'm with Dynegy we have over 30,000 megawatts of
- 17 generation, 13,000 or so which is in PJM. I just want to
- 18 re-emphasize that being an independent power producer and
- 19 not a utility we rely on being the most economic person out
- 20 there. We focus on our cost structure and we want to
- 21 compete on a level playing field.
- 22 We are neutral as to technology and it just comes
- 23 down to what's the cheapest megawatt we can get to the
- 24 customers. And if we think about a term that creates fear
- in our supply when we hear, "hybrid."

- 1 Hybrid is the worst market. You are doomed to
- 2 failure if you go down the hybrid road. Most of Zone 4 is
- 3 hybrid. All of the generation in central and southern
- 4 Illinois will vanish with the latest subsidy given to
- 5 Excelon and capacity clearing at 5 cents for KW month, those
- 6 plants were just put in the uneconomic category.
- 7 So having a model that starts blending cost of
- 8 service, starts blending other things into it that bleeds
- 9 into the competitive price formation is in fact going to
- 10 unravel the market. In the session today you know I hear the
- 11 terms that we are looking to accommodate are work in harmony
- 12 or work in partnership.
- 13 It's kind of like we are looking now to fix the
- 14 barn door when the horse has already ran out. The problem
- 15 exists, these subsidies that are in the market are having a
- 16 material effect on price formation. And when you think
- 17 about the motto, "The bend don't break," it's kind of where
- 18 we have been today.
- 19 I think Arnie in your question, your comment was
- 20 the little things you kind of let go. And really I think
- 21 that's essentially what has happened. But I think as David
- 22 Patton pointed out earlier today the subsidies coming from
- 23 nuclear is a whole different ballgame and that has a
- 24 significant material effect on our portfolio.
- 25 And if you look at the market cap of the

- 1 independent producers, what it's done in the past year it's
- 2 collapsed. Investors have lost confidence in the states and
- 3 the very thing that the states are worried about in terms of
- 4 creating instability, the state policies that are bleeding
- 5 into the competitive price markets are in fact going to
- 6 cause the instability that they are worried about and that's
- 7 why we need to fix it.
- 8 You know it is great to talk about other
- 9 solutions but it would be great to talk about the solutions
- 10 before the problem exists. Kind of back when I was
- 11 listening to the panel earlier it kind of reminded me about
- 12 basketball in the 1980's when Princeton would get a 2 point
- 13 lead and they would give it a 4 corners and never get the
- 14 ball back right?
- 15 The other team -- you know the clock would run
- 16 out and that's what's happening in the IPP. Excelon has
- 17 their 10 billion dollars in subsidies so now they are
- 18 interested in having a discussion about to see if there is
- 19 another way.
- 20 In the meantime that's bleeding into the market
- 21 and impacting us. I think the final thing that I would like
- 22 to point out is you take Ohio as an example -- we are the
- 23 largest generator in Ohio, we're also one of the largest
- 24 retail providers in the state of Ohio.
- 25 Last year there was a battle with two of the

- 1 incumbent utilities where they wanted to fix the purchase
- 2 price contracts with coal plants two of which we had
- 3 ownership stakes in but would not have covered our portion
- 4 of the ownership stake.
- 5 And the argument at that time was we are going to
- 6 eliminate price volatility as we heard earlier today. And
- 7 eliminating price volatility by putting at all time high
- 8 prices and promising never to move it is a necessary
- 9 solution for the consumer.
- 10 I thought the comments from Sierra were very well
- 11 on point that the consumer needs to be brought into the
- 12 discussion as well to think what's the appropriate way to do
- 13 it? So two of those plants that PPA's were going to -- that
- 14 were being fought for before FERC stepped in last year, we
- 15 have just announced that we are retiring them.
- So 3,000 megawatts of coal plants in Ohio are
- 17 going to be retired in June of 2018 at just a year ago we
- 18 are going to purchase a power agreement that's significantly
- 19 above market rates so when the comment that we heard a
- 20 moment ago that there's excess reserves in PJM that's
- 21 because it's been a really competitive market and people are
- 22 grabbing to anything they possibly can.
- 23 But those assets will exit the market if you
- 24 allow the proper price formation to occur and the proper
- 25 price signal. So my one message to leave with FERC -- their

- 1 involvement with Ohio was welcome. We got the right
- 2 decision and to these other things we can't stand and sit
- 3 back and see what's going to happy.
- 4 We have got to take the leadership role before
- 5 the instability starts really bleeding to the market because
- 6 again the independent power producers -- we rely on the
- 7 capital markets. And the capital markets are not being kind
- 8 to us now because of their lack of confidence in what's
- 9 going on in the design of the marketplace, thank you.
- 10 MR. QUINN: Joseph?
- 11 MR. BOWRING: Thanks to the Commission and staff
- 12 for inviting me to speak here today. The PJM markets have
- 13 worked so it is a little surprising to me that we are having
- 14 such long conversations about how to intervene in them and
- 15 change them. Progress is good so it is good to keep
- 16 thinking about new ideas.
- 17 But let's not forget they have worked since 1999,
- 18 worked very effectively. Are they perfect? Well you know
- 19 we write 700 pages once a year and every quarter to indicate
- 20 why we think they are not perfect but they are pretty close.
- 21 They are doing their job as Andy said they managed to
- 22 successfully deal with the retirement of more than 20,000
- 23 megawatts of coal, replace it with gas.
- 24 And the point of markets after all -- and they
- 25 have been doing this, is to provide power to customers at

- 1 the lowest possible cost. That's what markets do and they
- 2 have been doing it very successful.
- 3 Are energy prices too low? I don't think so. 10
- 4 years ago load would tell me that they thought prices were
- 5 too high and I would explain to them that markets pass
- 6 through the costs of inputs and there was some reflected in
- 7 the cost of coal and gas. And now I say the same thing,
- 8 the markets pass through the cost of inputs, the cost of gas
- 9 is low, prices are low -- are they too low?
- 10 Of course they are not too low. Ask customers if
- 11 they think that the price is too low. Does that then mean
- 12 we should step in and intervene and subsidize uneconomic
- 13 units? Again I don't think so. We have seen a series of
- 14 cases in Ohio, Illinois and elsewhere where units will have
- 15 to be subsidized simply because they are now an economic.
- And to pretend that does not have a significant
- 17 impact in the markets would be incorrect. We showed when we
- 18 did analyses in New Jersey and Maryland just a few thousand
- 19 megawatts of uneconomic capacity in the capacity markets has
- 20 a very substantial precedent on the market and effects
- 21 everybody, even if it is in one state.
- 22 So to actually directly answer your question
- 23 where do we draw the line? We draw the line where there are
- 24 significant impacts on price, significant courses and
- 25 decisions that ultimately the Commission has to make passing

- 1 off the difficult question to you.
- 2 But where there is an impact on price that
- 3 affects price formation, it affects uncertainty, it affects
- 4 incentives, it affects the ability of the market to function
- 5 to provide incentives for new entry and appropriate
- 6 incentives for exit.
- 7 So any such subsidy whether it's technology
- 8 specific, whether it is unit specific, whether it is for
- 9 some other particular social goal -- all should have that
- 10 same line drawn. That's the line where I believe that FERC
- 11 is responsible for maintaining the integrity of prices.
- 12 You want to make sure there's not price
- 13 discrimination in favor of specific technologies, thanks.
- 14 MR. QUINN: I think we will do Jennifer and
- 15 Gregory, I don't think you have had a chance to talk yet.
- 16 Then I want to make sure that we get to acting Chairman
- 17 LaFleur before she has to leave.
- 18 MS. CHEN: Hi thank you this is Jenny Chen with
- 19 the Sustainable FERC Projects. Thank you to Chairman
- 20 LaFleur and to Commissioner Honorable for having us and
- 21 staff as well. It's great to see you all.
- 22 The question that you asked Arnie is a good one
- 23 because it does -- it is a common theme amongst the
- 24 comments. But the problem is the question that you asked
- 25 assumes a certain problem and that problem has not been

- 1 well-defined and the question you asked is leading us down a
- 2 path that we don't think particularly solves and particular
- 3 problem.
- 4 So you are asking what is the distinction between
- 5 some of these various so-called subsidies and I want to tell
- 6 you that look if we keep going down that path the proposals
- 7 on the table that are supposed to solve that problem -- the
- 8 MOPR expansion and the two-tiered market, proposals that
- 9 stakeholders have discussed so far.
- 10 I'm not sure where that is going to get us. The
- 11 bigger questions that really need more attention right now
- 12 that could potentially solve what these questions that you
- 13 brought up might be trying to get at -- mainly supposed
- 14 price suppression in the capacity market I think are these.
- There is vast over-supply in the capacity market
- 16 in PJM. As folks have mentioned earlier today PJM cleared
- 17 22.4% capacity -- excess capacity and flask capacity option.
- 18 5.5 gigawatts of that was new gas so despite the over-supply
- 19 and relatively lower than expected clearing prices 5.5
- 20 gigawatts of new gas came on.
- 21 That, according to ICF brought the prices down by
- 22 15 to 25 dollars per megawatt day. So if you look at the
- 23 clearing price of 100 megawatts per megawatt day that's a
- 24 significant impact.
- 25 So if the question is what is so-called -- you

- 1 know what is supposedly suppressing the prices I would say
- 2 it is over-capacity. Whatever is driving all of this new
- 3 gas to come on despite the fact that we have plenty of
- 4 capacity on the system.
- 5 So that's a significant driver that we have not
- 6 been looking at. The other question that I think is a
- 7 bigger question along with the over-supply question is --
- 8 really the question is how can you better accommodate some
- 9 of these state preferred resources in the capacity market?
- 10 So for example we look at poll after poll from
- 11 customers from voters, we know they want clean energy. We
- 12 know that even amongst Trump supporters that at least 75%
- 13 want accelerated -- want the acceleration of clean energy
- 14 adoption.
- 15 All of the PJM states, the vast majority of
- 16 people polled want at least 20% -- this is the question
- 17 asked, they want at least 20%, the utilities to procure at
- 18 least 20% wind and solar. So when you look at the capacity
- 19 market and PJM today you have a capacity market that
- 20 procures 167,000 megawatts of capacity and only about a
- 21 gigawatt, 1.3 gigawatts of that unforced capacity is wind
- 22 and solar, that's less than 1%.
- 23 So there's a vast disparity between what
- 24 consumers and what states want as shown by their RPS's and
- 25 what's actually clearing the capacity market. So those are

- 1 the two main questions that I would love to see more
- 2 emphasis on but I can answer your question Arnie.
- 3 The distinction is push comes to shove is that
- 4 there are a lot of environmental policies that are
- 5 attempting to address the fact that the market does not
- 6 internalize externalities associated with pollution. Carbon
- 7 is one of them but there are many other forms of pollution.
- 8 So there could be a set of policies that aim to
- 9 procure newer resources, technologies that are still scaling
- 10 up, that are still seeing cost declines -- these are not
- 11 unit by unit, these are not targeted at existing units that
- 12 have been shown to be uneconomic over time, these are newer
- 13 resources that typically do as we have seen in the past,
- 14 have a legitimate -- why do I want to use the word
- 15 legitimate, but we have seen governments intervene to help
- 16 scale up these types of resources.
- 17 If you have a large unit and I think Joe covered
- 18 this pretty well that might significantly impact the
- 19 clearing prices depending on whether it clears. I mean that
- 20 might have a bigger impact. But again I'm not sure it's
- 21 taking us in the right direction and it is a very fuzzy
- 22 distinction so with that.
- MR. QUINN: Gregory then we will go to
- 24 Commissioner -- acting Chairman LaFleur.
- 25 MR. POULOS: Thank you. I appreciate the

- 1 opportunity Chairman LaFleur, Commissioner Honorable and
- 2 Commission staff. I appreciate the opportunity to be here.
- 3 Just to make clear I am here today on behalf of the Joint
- 4 Consumer Advocates which is 5 of the 13 Consumer Advocate
- 5 offices within the PJM region those being Delaware Division
- 6 of Public Advocate, Illinois Citizen Utility Board, New
- 7 Jersey Division of Rates Council, the Pennsylvania Office of
- 8 Consumer Advocate and West Virginia Consumer Advocate
- 9 Division.
- 10 To be very clear I had to make that point because
- 11 there are many of the Consumer Advocate Offices that have
- 12 already taken positions. For example the Ohio Consumer
- 13 Council has taken positions at FERC in proceedings on this
- 14 which is mentioned in my footnote in my comments.
- 15 So the Joint Consumer Advocates were the ones
- 16 that made the comments -- these 5. And they are a very
- 17 diverse group and I think to your point that you made with
- 18 the Commissioners that they are a very diverse group, I have
- 19 a subset of all of those.
- 20 And the diversity range is completely on both
- 21 ends of the spectrum where they see state actions, where
- 22 they see the market running and I can tell you that you hit
- 23 the issue right where I did as I'm getting off and running
- 24 as the Executive Director for the PJM Consumer Advocates.
- 25 It certainly hit a high note of where that

- 1 distinction comes, where's that line and I think what we
- 2 tried to do is tried to get down to those basic principles
- 3 first. What do we look at first for PJM?
- 4 PJM we looked at it first and saw this is a very
- 5 competitive market. It's getting us reasonable rates for
- 6 the most part, reliability is there and probably most
- 7 important -- at least for me, for my opinion is the new
- 8 entry. We have natural gas which came kind of out of
- 9 nowhere in some respects and in substantial amounts and
- 10 really brought this discussion to a head which is so
- 11 important to have that opportunity for new resources to
- 12 enter the market and to compete.
- 13 That's a key factor for what we looked at and
- 14 thought is a very big part. Now where do we go from here?
- 15 Because one thing we are concerned with is -- while it is a
- 16 reliable market there hasn't been sort of administrative
- 17 fixes put in place with the capacity performance for
- 18 example.
- 19 And how that has impacted resources like the
- 20 demand response and your energy efficiency and their ability
- 21 to participate along with new resources -- and those have
- 22 really been a concern particularly the impact on consumers
- 23 to participate in the market and consumers are the ones who
- 24 bear the costs of this market.
- 25 So the fact that we are reducing their ability to

- 1 impact their own pricing is of great concern too. So when
- 2 you put administrative fixes in if you do too much you are
- 3 going to impact new entry and consumers to affect their own
- 4 prices.
- 5 So those are some things that we really have a
- 6 concern about. Again, the whole spectrum probably PJM and
- 7 the IMM are probably the two best to give us information and
- 8 to keep us getting involved and that dialogue is so critical
- 9 for us to know what's going on and what's the best chance.
- 10 And in the end this issue where the line is drawn
- 11 it really depends on the circumstance because states each
- 12 have their own interest. Every state is going to have their
- 13 own interest from all the way over to Illinois all the way
- 14 to New Jersey they all have different interests. And it is
- 15 hard to tell specifically how that interest is impacted and
- 16 where that line should be drawn without knowing the specific
- 17 circumstances, thank you.
- 18 MR. QUINN: Thank you, Chairman?
- 19 CHAIRMAN LA FLEUR: Well thank you Arnie and
- 20 thank you to everyone today. About the only thing that
- 21 could make me leave is being summoned to the hill so that's
- 22 why I'm leaving, but I will be back tomorrow morning.
- 23 First a comment and then a question -- as I was
- 24 listening to Bob Flexon talk about the IPP model and where
- 25 it falls out I felt like it is like hearing a mirror image

- 1 or you know how people used to play the Beatle's albums
- 2 backwards to see if there were codes.
- 3 In like the late '80's and early
- 4 '90's and all the years leading up to the beginning of the
- 5 markets and all it was the IPP's having been created after
- 6 -- wanted to come in and compete with the utilities that
- 7 were buying things at the direction of the state regulators.
- 8 And now we are hearing sort of a flip side of
- 9 like state regulators are wanting to buy things to come in
- 10 and compete with the utilities. And if I had any question
- 11 on that there are gears you know, changing here it's been
- 12 removed.
- To Arnie's question I just want to say I don't
- 14 have any interest in trying to figure out if state policies
- 15 are right or state policies are wrong. I'm pretty sure
- 16 that's not my job. I look at the prism from the other end
- 17 -- is the price that the market that we are in charge of
- 18 just reasonable and non-discriminatory and that gives me a
- 19 preference if we can get there for pricing an attribute --
- 20 like if you are looking for more environmental externalities
- 21 to be priced in Jennifer pricing that, rather than just you
- 22 know, giving money to specific units.
- 23 And in Andy Ott's pre-filed testimony I believe
- 24 he said that even if the whole region could agree on an
- 25 attribute as long as you got critical masses of states to

- 1 come together. If a bunch wanted to price carbon and
- 2 another bunch wanted to price this resilience if we can
- 3 figure out what it is and so forth -- that might work.
- 4 And I guess I just wanted to push on that a
- 5 little bit more. Do you think there are groups of states
- 6 that can gel like that because how much critical mass does
- 7 it take to hold the PJM market together? Because I happen
- 8 to agree in large measure with Joe and whoever said the
- 9 Hippocratic Oath earlier -- we don't want to mess up what
- 10 has worked.
- 11 So I mean how do you see that? It intriqued me
- 12 so -- and I know Mr. Bailey has a question.
- 13 MR. OTT: I think there are two -- so part of my
- 14 desire within PJM is for us to take action where
- 15 appropriate. And again I don't have -- like I can't wait 3
- 16 years to do this, we need to do things now. So one of the
- 17 things that we are hoping for from the Commission is give us
- 18 a time frame -- put a time frame on us to deal with this
- 19 issue of figure out a way to -- you know we call it
- 20 harmonize but rationalize if you will these issues and
- 21 capacity market and make sure the capacity market is
- 22 protected.
- 23 Second is we haven't spent a lot -- we spent a
- 24 lot of time on capacity performance and capacity markets and
- 25 PJM, we haven't spent as much time looking at how the energy

- 1 market needs to adapt.
- I think there's two fundamental adaptations.
- 3 One as you said Chairman LaFleur, is to look at can we price
- 4 -- for example public policy attribute like carbon within
- 5 the PJM market and very quickly as Roger had indicated. We
- 6 aren't going to have agreement across all 14 jurisdictions.

- 8 However, the competitive states certainly may
- 9 have a chance to do that. And I think having some type of
- 10 pricing mechanism available to them and protect the other
- 11 states by having some kind of transfer price at the border
- 12 of that I think will work and we have thought about that.
- 13 CHAIRMAN LA FLEUR: California?
- 14 MR. OTT: Right. So the point is I can't answer
- 15 your question how many is it going to take but what we can
- 16 is start the dialogue how that would work and work through
- 17 the details with folks.
- 18 But more importantly there is a fundamental
- 19 inconsistency within our energy market that we need to be
- 20 resolved and I need your help to give us basically a time
- 21 frame to get that done.
- 22 And again, it's got to be relatively short. And
- 23 this comes back to we have negative prices in our market, we
- 24 have some environmental attributes priced into our energy
- 25 market, some are not. It's causing a de-valuation frankly

- 1 and it's already causing distortion in our energy market.
- 2 We have tried to politely ignore these things but
- 3 they are no longer ignorable. We really need to address
- 4 this in the energy market. We try to move 4 or 500
- 5 megawatts of wind and we have negative prices for a
- 6 substantial number of hours, it's not sustainable.
- 7 And it de-values assets that are inflexible and
- 8 can't move because they have to be on-line anyway, that's
- 9 one issue. Another is the fundamental notion that the way
- 10 the electricity prices are formed -- and I think I will
- 11 commend the Commission for having an open docket on energy
- 12 price formation but I think we need to go deeper there we
- 13 need to look more broadly at what's necessary.
- 14 Because I think that the attributes of those big
- 15 inflexible resources in the energy market goes beyond just
- 16 these other prices. So I do believe we can attempt -- also
- 17 the resiliency thing is not a myth -- there is an issue of
- 18 resilience and it comes back to you are not pricing an
- 19 attribute.
- 20 What you are doing is changing the definition of
- 21 reserves. You are changing the definition of contingencies
- 22 and that will pass through the energy market and the reserve
- 23 fund. We don't need to create a new market.
- 24 So for example today in PJM there are certain
- 25 circumstances under certain breaker configurations where we

- 1 are going to lose two nuclear units during that maintenance
- 2 period. We operate with instead of 2,000 megawatts a spin
- 3 we might operate 3,000 for example.
- 4 What I am saying is we should extend that same
- 5 mindset to say if we have a common mode risk, operational
- 6 risk where we could have a pipeline event and lose 4 or 5
- 7 gas units at once, we should operate with that much in the
- 8 reserve. And so it's changing the definitions of reserves
- 9 which would enhance the value then of those resources that
- 10 provide those resources, do you see what I mean?
- 11 CHAIRMAN LA FLEUR: I don't say that that
- 12 resilience is -- and I tried to say resilience rather than
- 13 resiliency but that's a battle I'll never win resiliency has
- 14 taken over. But I don't value that resilience is a thing.
- 15 I just get suspicious when there is a word that means
- 16 different things to so many people who use it.
- 17 Like a few years ago it was back to basics but a
- 18 lot of different -- and so I just think anytime you price
- 19 something like we found with capacity performance there are
- 20 going to be winners and losers.
- 21 MR. OTT: Right.
- 22 CHAIRMAN LA FLEUR: And whatever it is you are
- 23 pricing we better be sharp about it to make sure that we
- 24 don't have inadvertent consequences and need another
- 25 correction.

- 1 MR. OTT: And the way I think about resilience to
- 2 try to put it maybe in English is it is really looking at --
- 3 is the N minus 1 criteria we are offering to -- is it still
- 4 sufficient?
- 5 Are we seeing more operational risk than we are
- 6 willing to tolerate and in certain circumstances should we
- 7 be pricing into the energy market and reserves markets a
- 8 higher standard of margin if you will. I don't see this as
- 9 a huge state change, it's really saying let's be more direct
- 10 about the operational risks that we see emerging because of
- 11 these other threats and let's price them accordingly --
- 12 that's how you should think resilience.
- 13 It's not a brand new product, now the by-product of that
- 14 though --
- 15 CHAIRMAN LA FLEUR: It's almost like reserve is
- 16 an ancillary services market or an energy reserve?
- 17 MR. OTT: It would enhance the ancillary it is
- 18 not defining a new one. But let's think about if you have a
- 19 risk on a loss of 4 or 5 gas plants in a certain area in the
- 20 system that would enhance the value of the other plants that
- 21 don't have that dependency for that period.
- 22 So from a point of view that would put value on
- 23 fuel assurance but it doesn't create a fuel assurance
- 24 ancillary service, it just puts value on the attribute
- 25 because it's inherent in preserving reliability -- that's

- 1 the point and today we ignore it.
- 2 CHAIRMAN LA FLEUR: Thank you. I am going to say
- 3 thank you to everyone and while I have this audience of
- 4 maybe hundreds of people on the computer or whatever I want
- 5 to say we have heard an awful lot of people say the
- 6 Commission has to do this immediately.
- 7 We have been waiting for this. The Commission
- 8 has to give this -- time is of the essence, we need more
- 9 Commissioners to be able to address some of these things.
- 10 So whoever is listening out there in cyberspace that would
- 11 be our hope.
- 12 COMMISSIONER HONORABLE: I'll tweet your message
- 13 out.
- 14 CHAIRMAN LA FLEUR: At POTUS.
- 15 COMMISSIONER HONORABLE: Arnie if you don't mind
- 16 I want to yield to Mr. Bailey and any other of your
- 17 questions and I'll jump back in, thank you.
- 18 MR. BAILEY: I wanted to connect two or three
- 19 dots and hope this is somewhat on point to your question.
- 20 One I heard about what the public wants. Two -- I have
- 21 heard about affordable electricity prices and three I have
- 22 heard about coal retirements in PJM.
- 23 My organization represents Coal Fleet. I'm not
- 24 here advocating that people burn more coal but I am here
- 25 advocating that we do need a certain amount of coal for our

- 1 generation whether it is PJM or MYSO or anywhere else.
- 2 We view the Coal Fleet as more of an insurance
- 3 policy. You can call it a hedge, you can call it any number
- 4 of things. PJM at one point in time Mr. Ott I think it was
- 5 80,000 megawatts of coal. 20,000 megawatts have gone away.
- 6 Let's just say for the sake of argument those are
- 7 small or inefficient or uneconomic units just for the sake
- 8 of argument. So we are facing another 8 or 9,000 megawatts
- 9 of coal retirement over the next 2 or 3 years. There are
- 10 out of market upstate renewables.
- 11 We have talked about New York and Illinois we are
- 12 all familiar with that. There are arguably out of market
- 13 penalties, you can call those market penalties or out of
- 14 market penalties it doesn't make any difference, they are
- 15 penalties on the Coal Fleet.
- 16 We are guesstimating that the Coal Fleet and PJM
- 17 face another maybe 15 billion dollars-worth of environmental
- 18 compliance expenditures. Those are round numbers somewhere
- 19 in the order of magnitude number unless the markets allow
- 20 those electricity generators to recover those compliance
- 21 costs in some fashion there will be more coal retirements.
- 22 And at that point we think to use this term
- 23 "resilience" which we are all wrestling with right now -- it
- 24 kind of sounds good. It looks to us the resilience of the
- 25 grid is threatened at that point.

- Our bottom line on this is whatever action can be
- 2 taken to reduce the number of coal retirements whether it is
- 3 taken by the Commission or by PJM or by MYSO or by the
- 4 states, we are all for that, thank you.
- 5 MS. CHEN: Thank you, so I want to address those
- 6 points and also the point that Paul made. So on resilience
- 7 you know PJM did try to address the resilience point with
- 8 what happened after the polar vortex. That was an event
- 9 that was not anticipated and I do want to remind everyone
- 10 that resilience isn't just about fuel assurance, it's not
- 11 about fuel security necessarily because flexibility of the
- 12 system can help ensure resilience as much as actual fuel --
- 13 having fuel on the premises.
- 14 So in the 2014 polar vortex we learned that
- 15 actually it was demand response and fuel resources that came
- 16 to the rescue to ensure that the grid could continue
- 17 functioning. It was the coal, the coal piles had frozen
- 18 coal deliver was interrupted and 13.7 gigawatts of coal
- 19 worth of capacity was not able to perform.
- 20 So we do need to be careful if resilience is the
- 21 goal that we are not singling out fuel security as a means
- 22 of ensuring resilience -- flexible demand, storage, ensuring
- 23 that we have enough transmission -- all of these things go
- 24 together.
- 25 On the coal the statistics that Mr. Bailey

- 1 provided I do want to say that it's not the environmental
- 2 rules that are driving the retirement of coal plants. If
- 3 you look at the recent Columbia and Rhodium group study the
- 4 retirements due to coal are probably about 5% due to
- 5 environmental rules.
- 6 50% of the retirements is driven by low gas, low
- 7 gas prices and the abundance of natural gas and that is a
- 8 study that just came out in April, 2017.
- 9 Another 26% is due to declining demand so you
- 10 know I mean do -- do a broader study before you claim
- 11 environmental rules for that. I think that might be it for
- 12 now but you know I might have something later, thank you.
- MR. QUINN: Michael?
- 14 MR. COCCO: Thank you. I just want to reiterate
- 15 one earlier point that the market distress right now isn't
- 16 being primarily driven by subsidies, its being driven by the
- 17 market itself. We had tremendous advancements in shale gas
- 18 drilling technologies and you couple that with highly
- 19 efficient combined cycle units and you create very low
- 20 prices and that by itself is creating distress in the
- 21 market.
- 22 So the units that are primarily impacted by these
- 23 are the traditional to raise the term base load being an old
- 24 IRP guy, the solid fuel plants in the market. And so the
- 25 issue then turns to -- these are the ones that maybe on the

- 1 economic bubble and the issue turns to two terms that I
- 2 haven't quite grafted the meaning -- fuel diversity and
- 3 resiliency.
- 4 I just want to caution the Commission and staff
- 5 about going too quickly to address fuel diversity. I
- 6 believe that you know that's something that's an old IRP
- 7 plan or something we used to consider to cover if one fuel
- 8 went out you had a different fuel source.
- 9 But in a merging market if you are not protecting
- 10 the people who are paying for that diversity may not be the
- 11 ones receiving the benefits. If gas prices go up and we are
- 12 subsidizing the solid fuel units the people that get the
- 13 advantages are the merchant players themselves, so that's
- 14 point one.
- 15 I think there is a legitimate issue around
- 16 security and diversity but I think -- I don't think we need
- 17 to rush to the answer to that is to look at trying to favor
- 18 certain types of issues. I mean one thing we could
- 19 potentially be looking at if we are concerned about gas is
- 20 changes to the gas planning process or to maintain gas as a
- 21 secure fuel source -- secured fuel option for resources.
- I would just like to maybe just close with this.
- 23 I would ask the Commission to focus on a course out of
- 24 principles. One is that as an LSE at the table here
- 25 maintain a focus on reliable service at a just and

- 1 reasonable rate for end users, ensure that LSE's can enter
- 2 into long-term investments in generation and these
- 3 transactions are not only honored but encouraged.
- 4 Avoid the volatility of repeated reactionary
- 5 revisions to market designs. I personally don't see the
- 6 urgency to do something. I think it should be a well
- 7 thought out process and I think it is something that can be
- 8 addressed regionally at each RTO.
- 9 And adopt pulsar market policies which can
- 10 encourage resource diversity and accommodate -- I hate using
- 11 the word legitimate state policy objectives, thank you.
- MR. QUINN: Thank you, Lathrop?
- 13 MR. CRAIG: Thanks. I just wanted to respond to
- 14 a couple of things that Andy said actually. So Andy spoke
- 15 about some things that PJM is looking at to try to improve
- 16 pricing in the energy market which we are absolutely in
- 17 favor of you know starting with looking at ways to add
- 18 carbon value into the energy market.
- 19 But then also you referenced a number of
- 20 additional price formation concepts that we would agree
- 21 should be evaluated. The one thing and you know, we have
- 22 just started to hear this coming from PJM's -- it's very
- 23 early, I haven't seen the real details of how any of this
- 24 would be implemented which is obviously very important but
- 25 just one cautionary note that I have asked everyone to think

- 1 about is we kind of go forward on that journey which I hope
- 2 starts soon and moves quickly -- is that one of the things I
- 3 hear in that so far is this idea that because we maybe
- 4 haven't been identifying the right contingencies to plan to,
- 5 the response is to add additional reserves whether that's in
- 6 the capacity market or the energy market.
- 7 And I'm very cautious when I hear that because
- 8 one of the things that we have been hearing continually
- 9 through this is one of the biggest problems in the markets
- 10 right now is frankly over-supply and that's true both in the
- 11 capacity markets and in the energy markets.
- 12 And what I think is more important as we do this
- 13 is we figure out you know to put definitions and more
- 14 specific definitions around resilience about a change to
- 15 that word or that form of the word.
- 16 That what we are targeting is scheduling the
- 17 right resources, not necessarily just scheduling more
- 18 resources. I have been here a number of times trying to
- 19 show the impact of scheduling what we see as too many
- 20 resources and not allowing those to set price. What we need
- 21 to get right particularly if we want the signals to be
- 22 correct in the energy market is to schedule the right
- 23 resources and make sure that they do set price.
- MR. QUINN: Thank you, Robert?
- 25 MR. FLEXON: Arnie I wanted to follow-up on just

- 1 a couple comments on the coal, coal plants and retirement.
- 2 I would say that we have I guess approximately 12,000 -
- 3 13,000 megawatts of coal generation and we have pro-actively
- 4 have retired I'd say over 2,000 megawatts to date.
- 5 And a lot of those retirements and whether you
- 6 call it natural gas or environmental policy the two kind of
- 7 come together. Kind of the war on coal has always been you
- 8 know essentially driven by the underlying economics of
- 9 low-cost natural gas.
- 10 We have some of our coal plants next to combined
- 11 cycle plants that we run by gas sometime to 35 cents per
- 12 million BTU and there is nothing that can compete with that.
- 13 And those plants end up, you know, retiring. But
- 14 today it is different that whittling away at the market has
- 15 happened and those that aren't strong enough to survive this
- 16 environment with low prices have fallen to the wayside.
- 17 And the ones that are still standing it is
- 18 because they can and as a competitive generator we don't
- 19 keep any plant around that can't earn a positive cash flow
- 20 so the ones that we have right now do generate positive
- 21 returns.
- But the new war on coal is subsidies. Coal
- 23 cannot compete with nuclear subsidies right? And the reason
- 24 that nuclear is looking for subsidies, because as everyone
- 25 has said and acknowledged it is uneconomic.

- 1 And I thing I would pair with a wind asset is a
- 2 nuclear asset. I mean the wind assets need flexible
- 3 resources and if you are going to pair it up with nuclear
- 4 you are not going to accomplish what you want.
- 5 My view on competitive markets is if anybody that
- 6 owns a nuclear unit wants to run them have at it. I mean
- 7 it's their right to run them, they run them very, very well
- 8 they do a good job with all of that and go ahead and run it.
- 9 But don't lean on out of market subsidies to make it work.
- 10 You know if you want to run it, run it to your
- 11 own balance sheet. Run it to your own investors and if
- 12 that's what your investors want you to do then do it. If
- 13 you are losing a ton of money you can do that, you can
- 14 answer to your shareholders if you want to do that otherwise
- 15 you have to make the same tough decisions that we have to
- 16 make that have coal plants.
- 17 MR. QUINN: Thank you Gregory?
- 18 MR. POULOS: Just two comments from some of the
- 19 Joint Consumer Advocates that I heard during their
- 20 discussions. One about resiliency -- Mr. Erwin I think you
- 21 pointed out this first on the previous panel that if there
- 22 was an issue with resiliency or reliability the consumers
- 23 would look at their Commissions first -- consumer advocates
- 24 too but their Commissions first.
- 25 So I do think that that goes more to speak to

- 1 state's interest and their state interest in making sure
- 2 that they have the adequate mix and the ability to make sure
- 3 they have a reliable -- that's one of their key priorities
- 4 that they have the right mix of resources going forward.
- 5 I also -- one of the things that has become a
- 6 little more recently for the Consumer Advocates and the
- 7 Joint Consumer Advocate group is the gas line pipeline
- 8 infrastructure. And you know as we go more and more towards
- 9 gas we have this electric grid that's pretty well regulated
- 10 and pretty well documented and a number of controls on it.
- 11 How does a natural gas line pipeline
- 12 infrastructure of the same quality as we throw more to rely
- 13 on it where does that come into the picture? And I think
- 14 that is something where we as the Joint Consumer Advocates
- 15 feel very strongly that it helps to have PJM as a group who
- 16 is out there looking at this issue and working with us to
- 17 make sure we have the information to take back to our
- 18 consumers to give them the confidence going forward.
- 19 That is certainly an issue that we are looking
- 20 more and more at.
- 21 MR. QUINN: Thank you, Raja?
- MR. SUNDARARAJAN: Yes a couple of comments. One
- 23 is on the price formation side that Andy had mentioned AEP
- 24 would be fully supportive of changes on the energy markets
- 25 in addition to capacity markets.

```
1 Because I think as you all know the price
```

- 2 suppression is not just in capacity but in energy markets
- 3 also and that needs to be addressed in order to fully value
- 4 these assets in a proper manner.
- 5 The second thing is responding to Chairman
- 6 LaFleur's issue on state subsidies -- which ones can be
- 7 centralized, you know which ones can be incorporated inside
- 8 the market. A word of caution that we would throw is let's
- 9 say you go on the path of incorporating environmental
- 10 attributes into the markets.
- 11 Now yeah you can probably create a construct
- 12 where states that don't value a number of environmental
- 13 attributes are effectively not paying for them. And first
- 14 of all we still need to see evidence how that can happen.
- 15 Secondly, which also you understand that now you
- 16 set once you go into the centralized market now everything
- 17 else follows. The transmission planning process follows
- 18 what's at the RPA and what assumptions RPM markets make.
- 19 Let's say the environmental attributes are
- 20 incorporated into the wholesale markets -- now you have say
- 21 how do I modify the conventional planning process to make
- 22 sure that states that don't value environmental attributes
- 23 are suddenly not paying for transmission assets that have
- 24 been coming out as a result of incorporation of these price
- 25 signals into the wholesale markets.

```
1 And as you all know when Order 1000 started the
```

- 2 Commission issued a mandate on public policy requirements to
- 3 be incorporated in the transmission filing process. And PJM
- 4 clearly responded along with the stakeholders that the best
- 5 way to solve that issue is I can decide which states are
- 6 going to incorporate -- what assumptions they were going to
- 7 make in the transmission planning process so they let each
- 8 state come up with an assumption and what would effectively
- 9 create a state agreement approach and those costs being
- 10 allocated to those states that effectively sponsored those
- 11 projects.
- 12 So now you have -- let's say you go on the
- 13 construct of incorporating these price signals into the
- 14 centralized market -- how does it change the transmission
- 15 planning process? How does that result in effectively not
- 16 opening the state agreement that was effectively blessed by
- 17 the Commission and was agreed by the states, how does it
- 18 impact that?
- 19 Now just a word of caution so that you understand
- 20 the downstream ramification of incorporating certain
- 21 subsidies -- certain price attributes into the centralized
- 22 market which is none. And that's why we actually believe if
- 23 states -- if you believe states are going to do whatever
- 24 they believe is a long-term solution to pricing attributes I
- 25 think you can't get away from the fact that you need a

- 1 bilateral market that is co-existing with the RPM market so
- 2 that A -- that provides clear stability to the costs that
- 3 are being allocated for those attributes not to permeate to
- 4 the other states that don't.
- 5 And the second thing it has little or no
- 6 ramifications on other aspects of the RPO which includes
- 7 transmission planning and everything else that the RPO
- 8 supposedly incorporates. And nothing says that bilateral
- 9 contracts can be compared to any provider like Dynegy or
- 10 anybody else all it provides are better long-term price
- 11 signals that the LLC is currently looking for as opposed to
- 12 relying on the spot market RPM.
- MR. QUINN: Joe?
- 14 MR. BOWRING: So just a couple of small points to
- 15 begin with. First of all not all nuclear units are
- 16 uneconomic and secondly not all coal units are uneconomic
- 17 just as a basic fact since we seem to be missing that.
- 18 To address Commissioner LaFleur's question about
- 19 a partial carbon price -- so if we are right about everyone
- 20 liking it and all the polls show everyone liking it there
- 21 shouldn't be a problem getting all 13 plus 1 political
- 22 entities on board, so maybe that's true maybe it's not.
- 23 If it is true then there should be a way to do
- 24 it. One thing to think about is it is entirely consistent
- 25 with a rational carbon pricing scheme to return all the

- 1 dollars to those who pay them. So it does not have to be a
- 2 hurt to consumers who are paying higher prices because of
- 3 carbon price and carbon tax, this is point one.
- 4 And that's entirely consistent with the right
- 5 incentives. But more broadly I'm skeptical of a partial
- 6 solution but it would be better to be talking about that at
- 7 least and seeing if it could work than talking about the
- 8 kinds of subsidies we are talking about clearly a market
- 9 based solution with a carbon price is better than
- 10 subsidies.
- 11 I'm also skeptical of the ability of the capacity
- 12 market to have two prices or somehow the term was used
- 13 "accommodate" subsidies. I think that's a recipe for making
- 14 the capacity market residual and the capacity market cannot
- 15 work as a residual market.
- 16 Finally on resilience reliability I think that
- 17 resilience as it has been defined -- I mean I thought you
- 18 did a great job of defining it, it's another attribute,
- 19 another element of the liability. If after analysis it
- 20 makes sense to think about adding additional M minus 1 or M
- 21 minus 1 minus 1 constraints based on the gas system or
- 22 whatever else it might be then let's do that, but let's do
- 23 it based on analysis, let's do the dispatch phase again as
- 24 a market based solution not a technology specific solution
- 25 but it should be only after the appropriate analysis is

- 1 done, thanks.
- 2 MR. QUINN: Just to follow-up. Can you talk
- 3 about what you mean when you say the capacity market can't
- 4 be a residual market and how are you defining residual
- 5 market in that situation?
- 6 MR. BOWRING: Sure, so right now the capacity
- 7 market must offer -- everyone must offer, everyone must buy.
- 8 So the question is if you change that rule can it work? If
- 9 you say there are going to be two different prices for
- 10 capacity can it work?
- 11 If you say that suddenly it is going to be
- 12 voluntary and can be residual so residual would be some
- 13 capacity doesn't have to be in it. Now as it is well
- 14 understood, PJM has FR entities in part of the capacity
- 15 market but they entirely stand alone, entirely responsible
- 16 for their own reliability needs.
- 17 And it is consistent -- not a perfect solution
- 18 consists and doesn't work very well in parallel with the
- 19 capacity market. But if a state or an area says that they
- 20 don't want to be part of capacity market while still not
- 21 setting up as an FR entity -- then once you break the
- 22 requirement to buy and the requirement to sell then the
- 23 price formation simply won't be there.
- 24 Imagine only trying to buy a third of the
- 25 capacity or 50% of the capacity in the market. By

- 1 definition the price will not be a price consistent with
- 2 long-term reliability in the market. Does that answer your
- 3 question?
- 4 MR. QUINN: It does but I think I have heard and
- 5 maybe I've heard it today the discussion about residual
- 6 market being slightly different than that and being a market
- 7 where there are a set of resources that because of the
- 8 minimum offer price rules won't get through the capacity
- 9 market.
- 10 And that you find a way for them to get --
- 11 perhaps you supply obligation so they still want to move
- 12 through the capacity market and what's residual then is the
- 13 price signal for all the rest of the capacity that is not
- 14 going to have state support.
- 15 And it's a little bit of the model of the state
- 16 gets to go first. Their resource will find a way into the
- 17 capacity market, they are going to get a capacity supply
- 18 obligation and what the capacity market is doing is getting
- 19 the rest of the resources that it didn't get procured by the
- 20 state.
- 21 MR. BOWRING: And the reason I say that can't
- 22 work is Commissioner LaFleur asked earlier today -- that is
- 23 a slippery slope to which the end is all state subsidized
- 24 resources and all competitive resources because we have also
- 25 heard that creates uncertainty about the price, it creates

- 1 price suppression for the remaining fleet.
- 2 It simply can't work as a stable model. It will
- 3 end up resulting in ultimately the subsidized units pushing
- 4 out the unsubsidized ones.
- 5 MR. QUINN: Jennifer?
- 6 MS. CHEN: So I just wanted to -- I guess I have
- 7 a different understanding of the residual market and I don't
- 8 have a monopoly on not understanding it so thank you for
- 9 explaining that to me.
- 10 Well first of all we don't want to you know, we
- 11 would like to work together with PJM and stakeholders to
- 12 come up with you know, whatever proposal it is that we are
- 13 going forward with. But I don't think that's putting
- 14 subsidized resources or state preferred resources in one
- 15 bucket and all of the rest of the resources in a separate
- 16 bucket.
- 17 It really works out in terms of being a
- 18 principled non-discriminatory proposal simply because you
- 19 know we have done some work on this, subsidies are
- 20 everywhere and they are hidden.
- 21 If you only select out the most visible
- 22 subsidizes, like renewable portfolio standards you are
- 23 likely to select out the subsidies that receive the most
- 24 public support and you are neglecting all of those tax
- 25 exemptions, funds like black -- I looked up a whole bunch --

- 1 of different subsidies that go to fossil fuels but are
- 2 hidden and they are permanent.
- 3 They are not up for renewal. So they are not as
- 4 visible. It's very difficult to get at all subsidies and do
- 5 it in a principled manner in such a way that you could make
- 6 that division, that subsidized resource versus
- 7 non-subsidized and come up with a construct that's not
- 8 discriminatory. That's one thing that I wanted to react on.

- 10 The other point that I wanted to
- 11 talk about is that right now as Joe mentioned that capacity
- 12 market is a market where customers must buy from the
- 13 capacity market unless there is some sort of exemption.
- 14 But the demand curve is an administratively set
- 15 demand curve so you must procure a certain amount of
- 16 capacity from that market. That market only offers one type
- 17 of capacity product now. So you have to buy that kind of
- 18 capacity product.
- 19 Customers really need a choice. So if you have
- 20 -- so the kind of residual market that I have in my head is
- 21 that customers ought to be able to choose to go get the
- 22 capacity through some sort of bilateral contract or they can
- 23 go to the market if they prefer that.
- 24 And so the market needs competition too. The
- 25 market construct needs that kind of outside competition to

- 1 attract customers to the market. If you have a market
- 2 construct that offers what customers want they will come to
- 3 you and then you can have a robust market and you will have
- 4 better price formation in that way thank you.
- 5 MR. QUINN: Thank you, Lathrop?
- 6 MR. CRAIG: I'm sorry, I just wanted to respond
- 7 to a couple of the comments particular to nuclear economics.
- 8 Joe earlier said -- he asked the question if the price is
- 9 too low, of course not ask the customers you know if you
- 10 don't believe that.
- 11 And you know we've talked a lot about attributes
- 12 and I think what that kind of misses is the attributes that
- 13 thinks like nuclear generation like nuclear bring to the
- 14 table. So the other day I hadn't had anything other than
- 15 water since this morning so I'm thinking about coffee and
- 16 you know if you go ask the customers at the local coffee
- 17 shop that the \$1.00 cup of coffee is too expensive they are
- 18 probably going to tell you no, and a lot of them are still
- 19 going to walk across the street and buy a big venti mocha
- 20 caramel frappachino.
- 21 And that doesn't make the frappachino uneconomic.
- 22 It means as we have just heard that you know customers want
- 23 choices and they value other things and that's what we are
- 24 dealing with here. The prices are right for the inputs that
- 25 are currently allowed to go into them and they are pretty

- 1 effective actually at driving behavior based on those
- 2 things.
- 3 You know as a company we are responding to those
- 4 prices and so when I hear things like just say do the
- 5 markets work I really do -- I agree with that for the
- 6 limitations that they have for the product that they are
- 7 currently pricing and trying to get responses for.
- 8 We are currently investing in three new combined
- 9 cycle natural gas units, a lot of money 2 billion dollars or
- 10 so because we saw those price signals making very clear what
- 11 the market wants, what the market values is that kind of
- 12 economic efficient flexible generation.
- And at the same time we are less than a month now
- 14 from shutting down two of our coal plants in New Jersey
- 15 about 1200 megawatts responding to exactly those same price
- 16 signals.
- 17 But when we look at nuclear we ask ourselves a
- 18 question and we are starting to engage with our state on
- 19 asking that same question about whether those market signals
- 20 are sufficient and whether those prices that are ripe for
- 21 the inputs that they have been allowed to price out are
- 22 comprehensive enough, or if they were missing something.
- 23 And I think our answer is we are clearly missing
- 24 something. We see customers choosing to value the same kind
- 25 of attributes that nuclear brings and choosing to pay more

- 1 for it and that's a good indication that the prices while
- 2 may be ripe from on perspective are not completely ripe and
- 3 changes the view on whether something like nuclear is
- 4 actually economic.
- 5 MR. QUINN: I know that we want to get to
- 6 Commissioner Honorable but I see a number of tent cards up
- 7 so I will kind of run through who we have got but I would
- 8 ask you to kind of keep your comments brief so that we can
- 9 make sure that Commissioner Honorable has a chance to ask
- 10 her questions and everybody can go get coffee.
- 11 MR. FLEXON: Thank you I just want to first
- 12 compliment the Sierra and RDC because they are thinking in
- 13 the context of the customer which sometimes in our positions
- 14 and industry we sometimes lose sight of that.
- 15 And I just want to say when you think about
- 16 environmental attributes we have the retail business as an
- 17 example the City of Cincinnati came to us as a competitive
- 18 procurement process. They wanted an all green product. So
- 19 we went out and we got them an all green product and we are
- 20 seeing more and more in the marketplace on the retail side
- 21 that cities or individuals are looking for a green product.
- 22 We haven't had any consumer yet come to us to say
- 23 we want 100% nuclear product yet. So I think listen to the
- 24 customers and they are getting these retail green products
- 25 at a very cost effective price versus laying a multi-billion

- 1 dollar levy for just five locations.
- 2 So I think that's a real issue so those states
- 3 that have retail choice are accomplishing the goals very
- 4 efficiently and I just wanted to pass that on, thank you.
- 5 MR. QUINN: Thank you so I think I've got Paul
- 6 then Michael then Gregory and Raja.
- 7 MR. BAILEY: Thank you. I couldn't respect
- 8 myself if I didn't comment on subsidies for fossil fuels or
- 9 renewables. The University of Texas Austin study came out
- 10 in November of last year. It looked at various kinds of
- 11 federal subsidies for different energy sources.
- 12 They looked at the year 2010, they looked at the
- 13 year 2013 that projected the year 2016 that projected the
- 14 year 2019. The subsidies for wind averaged 4 billion
- 15 dollars a year. Subsidies for coal averaged 40 million
- 16 dollars a year, thank you.
- MR. QUINN: Michael?
- 18 MR. COCCO: I just wanted to dovetail on a
- 19 statement Jenny made. That is LSE's do need the ability to
- 20 buy out a contract to get the kind of products that they
- 21 need and they need to do so without any risk of having to
- 22 pay twice.
- 23 So I do like have concerns when I do hear terms
- 24 like MOPR and maybe other two settlement solutions that tend
- 25 to take the only market part out of the capacity mix. You

- 1 have a supply curve that is determined -- I mean a demand
- 2 curve that is determined by the RTO.
- 3 You have all the important constraints are
- 4 determined by the RTO and when you -- the only market part
- 5 of it is the supply curve offers and the minute you start
- 6 substituting something like some type of proxy type pricing
- 7 to set prices I just begin to express concern that we are
- 8 moving away from the markets.
- 9 Again I just advise the Commission taking
- 10 incremental steps to address this issue so that we don't
- 11 have any second and third order unintended consequences.
- MR. QUINN: Thank you, Gregory?
- 13 MR. POULOS: Thank you just as a point you had
- 14 made earlier about the line between where state actions that
- 15 should be paid for or subsidized or not and how that line
- 16 impacts -- and the nuclear facilities is the one example of
- 17 an example where there are some that are economic, some that
- 18 are not as Dr. Bowring mentioned before and that was
- 19 something the Consumer Advocate Offices and the Joint
- 20 Consumer Advocates raised that there was some of those that
- 21 we don't want to pay extra for nuclear facilities that
- 22 actually are economic and are clearing.
- 23 And in addition we also don't want to pay for
- 24 state actions of other states. We don't also want to pay
- 25 double or a third time for a resource. So as we are looking

- 1 at these there are going to be situational and it is going
- 2 to be something that we are going to have to play it one by
- 3 one as they come down the line to decide where that line
- 4 fits and those are just some of the examples that have come
- 5 up and some things that were just mentioned.
- 6 MR. QUINN: Thank you, Raja?
- 7 MR. SUNDARARAJAN: Mine is probably a short
- 8 comment. I know a couple of my colleagues here mentioned
- 9 about how the residual markets cannot work. On energy space
- 10 we have become sort of comfortable with it because
- 11 effectively you have renewables being dispatched and
- 12 negative pricing effectively to kind of set the price.
- 13 Everything else is kind of part of the states in
- 14 a residual manner. So, I find it interesting why it seems
- 15 to work in energy space whereas not in the capacity space,
- 16 thanks.
- 17 MR. QUINN: Commissioner Honorable?
- 18 COMMISSIONER HONORABLE: Thank you. And I want
- 19 to thank all of you for your spirited comments and also for
- 20 being disciplined enough to stop. You'll have enough time
- 21 to engage in some of that debate I'm sure.
- 22 And for some of it you are never going to
- 23 convince the others of your view, I just wanted to tell you
- 24 that now before you get started. I also appreciate that
- 25 maybe you guys haven't arrived at the place of urgency that

- 1 some of our other colleagues have in other regions and so
- 2 maybe if we spoke with you all in six months.
- 3 So in a year after you all have teed up some of
- 4 the things that Andy mentioned in his pre-Conference
- 5 comments that we may see more of your -- I guess more
- 6 clarify about your concerns about not only the tensions
- 7 within PJM but also as it aligns with or butts with your
- 8 sister regions and particularly because PJM is so diverse
- 9 and so large that I'm pleased though at the moment that you
- 10 don't seem to express the same sense of urgency.
- 11 I have taken to heart though in this comments and
- 12 I want to ask you all to add to the list about the topic of
- 13 wholesale energy markets and the development of state
- 14 policy. Someone tweeted earlier had I opened the door to
- 15 talk about enforcement and so on -- no I haven't. We are
- 16 still very focused now.
- 17 So early Andy put on the table what he thought
- 18 that you all could use from us and that is maybe just a
- 19 little padding by way of providing a deadline to give you
- 20 some impetus to begin to rationalize or harmonize these
- 21 maybe externalities and other forces that you think you need
- 22 to take a view of and consider whether to incorporate those
- 23 into your wholesale market processes.
- 24 And the other thing that Andy mentioned was and I
- 25 first want to start with Andy to put some meat on the bones

- 1 of this. He said that we need to go deeper on price
- 2 formation and I recognize that we still have work to do
- 3 there and I'm afraid to ask you Andy but I will -- what is
- 4 still left to be done?
- 5 And then I want to ask the other panelists in our
- 6 last few minutes what else can we do to support your work in
- 7 this area?
- 8 MR. OTT: Thank you Commissioner Honorable and I
- 9 will keep this brief. The energy market price formation I
- 10 think it is effectively I think the issues are similar to
- 11 what I think has already been discussed in the price
- 12 formation docket.
- 13 We have -- there are periods of time and I'll set
- 14 aside the negative pricing comments I had before because I
- 15 think that sort of stands alone but this is just pure price
- 16 formation. There are periods of time where we have
- 17 generators that are on-line and generating because we need
- 18 them to meet the current supply/demand balance on the
- 19 system.
- 20 So they are on-line running but they are not
- 21 permitted to set a price because we have rules around you
- 22 have to have a certain amount of flexibility and be able to
- 23 move around in order to set pricing. The reason for that of
- 24 course is that we need to somehow discipline the output of
- 25 generation in order to meet the supply/demand balance.

- 1 So the opportunity we have there is I think we
- 2 can look to price the commodity energy meaning based on the
- 3 supply/demand curve and where they cross and price
- 4 flexibility as part of you know a grid service and I think
- 5 that would create more accurate price signals for what we
- 6 need to serve the load that hour and reduce uplifts which we
- 7 all met with sort of the genesis of the price formation
- 8 docket, et cetera.
- 9 So I think there's just more we can do there if
- 10 we broaden the look and say let's not just look at fast
- 11 start resource, let's look at all resources and make sure
- 12 that we are not paying for resources we don't need --
- 13 COMMISSIONER HONORABLE: But we are making sure
- 14 that the participants are being compensated for the value
- 15 that they are providing.
- MR. OTT: Correct and the pricing is accurate.
- 17 And I think -- so as we look at that opportunity I think now
- 18 that one because it would be a controversial discussion does
- 19 need time frames, say do that by this date rather than you
- 20 all decide for us, tell us to discuss it et cetera but have
- 21 a time frame.
- 22 I think what's key here is that the resources
- 23 that are needed to serve the load should participate in
- 24 setting price it's as simple as that. This is not a
- 25 revolutionary concept. As we have grown over time here's

- 1 what's happened.
- 2 It used to be all the flexible resources were in
- 3 the cost curve were the mid-merits were the peaking plants.
- 4 And today we have inversion.
- 5 COMMISSIONER HONORABLE: It isn't.
- 6 MR. OTT: And I think the key is why we need to
- 7 look at it is because of that fundamental change in the
- 8 supplies. I think it would also help in areas with high
- 9 penetration of renewables to look at that type of formation
- 10 so I'll leave it at that but that's what we meant and that's
- 11 what I meant in this call to action.
- 12 Again it's really just looking at what's changed
- 13 on the system and why do we need to look at energy market
- 14 reform.
- 15 COMMISSIONER HONORABLE: I'd welcome that and
- 16 especially in view of the comment that someone made about
- 17 the need to have a bottom up approach. So I too want to be
- 18 disciplined and say okay PJM this is your deadline and this
- 19 is what we want back from you but to allow the process to
- 20 work and to really allow the stakeholders to add value.
- 21 And to inform us and then we can then respond to
- 22 your proposal.
- MR. OTT: Thank you.
- 24 COMMISSIONER HONORABLE: Thank you. Paul are you
- 25 participating, your tent card is still up, Michael? I

- 1 wanted to stay in my place Arnie but I was just going to
- 2 call on Michael.
- 3 MR. QUINN: I'm happy to take my place back.
- 4 MR. BOWERING: First of all I think there is
- 5 urgency in PJM. We have a nuclear unit right now which is
- 6 receiving subsidy from the state. It is going to affect the
- 7 capacity market which is happening in May.
- 8 It is as I have said, contagious. As a result of
- 9 that a number of other nuclear power plant owners, some of
- 10 which are economic or actively seeking subsidies from the
- 11 state so it is urgent and every bit of urgent as elsewhere.
- 12 It's a different kind of issue in this case.
- 13 COMMISSIONER HONORABLE: It is and you know I'm
- 14 aware of that because we have certainly ruled on some
- 15 dockets here but please continue.
- MR. BOWERING: Sorry it's urgent. And then the
- 17 second point is I actually disagree with Andy about the
- 18 energy price --
- 19 MR. OTT: Really?
- MR. BOWERING: Yeah I know shocking.
- 21 COMMISSIONER HONORABLE: In the last 5 minutes is
- 22 when the fireworks start, please continue.
- 23 MR. BOWERING: Just in 30 seconds what I worry
- 24 about I don't think is as simple as Andy said. I think in
- 25 fact what we are at risk of is subsidizing the inflexible

- 1 units giving more incentive to inflexible units.
- 2 I agree that what we need is more flexible units.
- 3 Flexible units to set price is the reason LMB works the way
- 4 it does, it's the reason it has been successful so I would
- 5 be urging not to rush into a decision on that one.
- 6 COMMISSIONER HONORABLE: Well what I can commit
- 7 to is that we would endeavor to develop a complete record
- 8 which allows for the viewpoints of many diverse stakeholders
- 9 to be accounted for.
- MR. BOWERING: Thank you.
- 11 MR. QUINN: Michael?
- 12 MR. COCCO: Just to the second part of your
- 13 question what can the Commission do and this may be a na ve
- 14 suggestion but I think it would be good if FERC had more of
- 15 a dialogue with the state Commissions to better understand
- 16 what type of programs they are coming forth with.
- 17 And to better understand their plans for how that
- 18 could be incorporated into the market. I see some smiles on
- 19 this side. I think that would be helpful. I don't know how
- 20 that is facilitated maybe it's a report or something that is
- 21 to the Commission but I think that sort of being proactive
- 22 with that approach might smooth out some of these issues.
- 23 COMMISSIONER HONORABLE: Thank you and we
- 24 certainly have endeavored to continue working with our state
- 25 colleagues. I'm delighted that so many of them could

- 1 participate in this Tech Conference and in fact we moved the
- 2 dates because we had originally considered April dates but
- 3 so many of them had other conflicts and we certainly
- 4 couldn't have this discussion without them.
- 5 And I think that around and during NEHRUC
- 6 meetings is a prime opportunity -- I would much rather have
- 7 an in-person dialogue and an in-person debate even about
- 8 some of these issues versus passing paper back and forth
- 9 although there's value in that, maybe that could culminate
- 10 our work together.
- 11 But I think it's a terrific suggestion, thank
- 12 you.
- MR. QUINN: Robert?
- 14 MR. FLEXON: Yes, quickly just following up from
- 15 this morning. I think one thing was clear that the various
- 16 participants identified that the state legislature are going
- 17 to do things and they have got to carry it out whether that
- 18 means procuring off-shore wind or even hydro whatever the
- 19 case may be.
- 20 These are very expensive types of forms of
- 21 generation and I think a take-away from today should be the
- 22 states if they are going to take these actions they must be
- 23 fully responsible for the cost of those actions.
- 24 And I think as Greg mentioned it should not bleed
- 25 into other states and it is very important to protect proper

- 1 price formation and the help that we need from FERC as well
- 2 as the various ISO's and RTO's is insuring that that
- 3 protection is there, that the policy is in place, the time
- 4 line is set because the market needs to see the confidence
- 5 that the competitive markets are going to function properly.
- 6 And without that involvement they are definitely
- 7 under duress I think as Joe just pointed out. We have got a
- 8 capacity option coming up this month where it is going to be
- 9 impacted by subsidies and so time is of the essence
- 10 particularly in PJM, ISO New England, New York and as
- 11 everyone has said litigation is the least desired path for
- 12 all parties.
- 13 And proactive involvement and the complete
- 14 welcome of FERC involvement is what we need, thank you.
- MR. QUINN: Greg?
- 16 MR. POULOS: Thank you for the question
- 17 Commissioner Honorable of what can the Commission do. I
- 18 would just interject here and say that just providing an
- 19 opportunity for the consumers to have a voice here was a
- 20 significant step.
- 21 I think it is showing the value that you place in
- 22 the consumer voice is very important and it spreads to the
- 23 other participants as well.
- 24 As others have reached out to me from Excelon and
- 25 from AEP just to get our voice as well -- so by you showing

- 1 the value in the voice it provides us an opportunity to have
- 2 dialogue with other parties so I really do appreciate this
- 3 opportunity.
- 4 MR. SUNDARARAJAN: That's Commissioner Honorable.
- 5 I think from AEP's point of view it's doable. One is you
- 6 are afraid that since the urgency is solving the
- 7 incorporation of environmental attributes in the wholesale
- 8 market it becomes the sole focus that the broader reforms
- 9 get sidelined.
- 10 So that's a big issue for us because now
- 11 everybody is taking about ZEC's or ZEN's or whatever the
- 12 formation of the emission credits is and that is one part of
- 13 the bigger problem that we see and that in our opinion is
- 14 overtaking all of this conversation without understanding
- 15 what the full scope of this problem is and how to solve it.
- And the second thing is there are states in PJM
- 17 who are not pursuing certain things and the cost shift is a
- 18 big concern. So I think agreeing on some principles,
- 19 defining what the problem is and agreeing on what principles
- 20 that we should adhere to can go a long way in terms of
- 21 coming up with solutions.
- 22 Because right now the solutions are being
- 23 addressed based on their interpretation of principles is and
- 24 that is leading to a whole lot of confusion within the
- 25 various parties and the state Commissions in what they are

- 1 trying to solve and how to solve it. So I think maybe some
- 2 docket that will open in terms of what the problem is and
- 3 you know what are we trying to solve and the key principles
- 4 that we adhere to can go a long way.
- 5 COMMISSIONER HONORABLE: Thank you and I
- 6 appreciate your point there needs to be a more comprehensive
- 7 review of what both action and inaction -- how those two
- 8 things impact market pricing and market operations.
- 9 And I think the gentleman from ODEC mentioned
- 10 some objectives earlier that might be a good starting point
- 11 for you guys when you take it back to the stakeholder group.
- 12 MR. QUINN: Lathrop then Jennifer.
- 13 MR. CRAIG: Thanks. As to what you know would be
- 14 most helpful coming back from the FERC you know I think you
- 15 have listened to three panels and a lot of diverse opinions
- 16 and as you noted we don't agree and we are not likely to.
- 17 I think what would be very helpful would be some
- 18 indication from the FERC after having listened to all of
- 19 this where do you see problems and where do you not see
- 20 problems. You know where is the action that is being taken
- 21 or contemplated just a normal and expected impact on the
- 22 market from a combination of the federally overseen markets
- 23 and state actions you know resulting in a particular outcome
- 24 and where is that potentially becoming a problem.
- 25 So tell us what problems it is we need to solve?

- 1 And then I would definitely agree that if the next step
- 2 after that is to go back into a stakeholder process which
- 3 may be appropriate time lines are always helpful because
- 4 without that I think we have seen time and time again that
- 5 they could take a very long time and then I will definitely
- 6 agree that FERC -- I mean some areas where some of us see
- 7 that there are problems that need to be solved, there are
- 8 things that need to be solved soon.
- 9 COMMISSIONER HONORABLE: Thank you, Jen?
- 10 MS. CHEN: I'll be super quick thank you. So in
- 11 terms of what FERC can help with and what stakeholders can
- 12 get started on right away I think it is the artificial
- over-supply problem.
- 14 Over the past 5 years 25,000 megawatts of gas
- 15 came on-line. I think that's right don't quote me on that
- 16 but projected going forward about 20,000 megawatts of gas
- 17 fired power is expected on-line by 2019.
- 18 Having over-supply is bad for both consumers and
- 19 generators and could result in surrender costs in the
- 20 future.
- 21 MR. BOWRING: Sorry, just real fast. There is no
- 22 over-supply. There's a downward sloping demand curve, we
- 23 bought what we bought on purpose. The price was lower than
- 24 it otherwise would have been and there were benefits on the
- 25 energy side more capacity to have cheapens the price of

```
1
    energy, thank you.
 2
                COMMISSIONER HONORABLE: Arnie if I might just
     jump in and say thank you not only to this panel. I see you
 3
    will have a lot of future discussions to take up and I want
 5
     to thank our entire group of panelists today as well as all
 6
    of you who sat all day long out in the audience.
 7
                And I especially want to thank our senior staff
    here at FERC and also the FERC staff who aren't so visible
 8
    here but who have worked very, very hard. Thank you so much
 9
     for an excellent day 1 and I look forward to day 2.
10
11
                (Whereupon the meeting was adjourned at 5:34 p.m.
     to reconvene the next day, May 2, 2017.)
